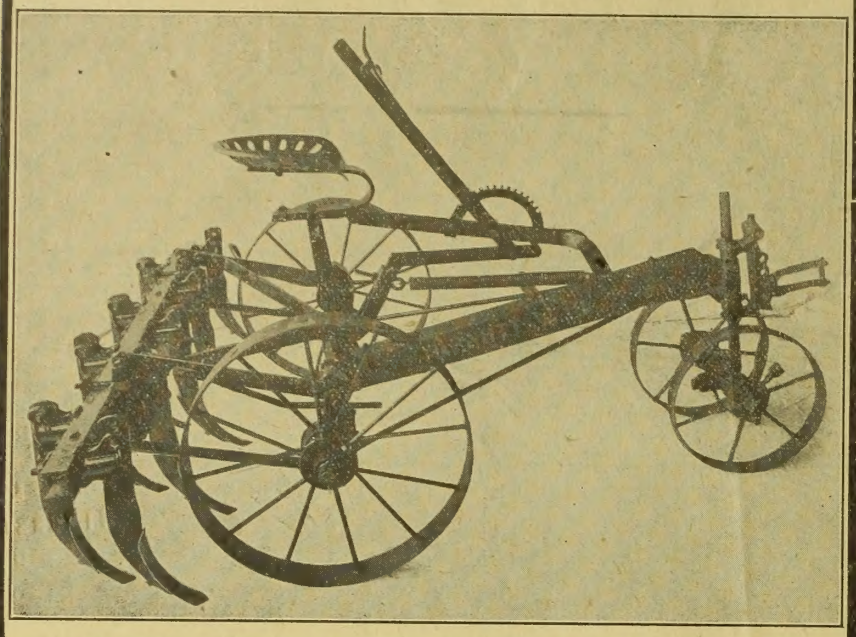
Stacking Alfalfa at Brawley.

The Arnott Improved Orchard Cultivator

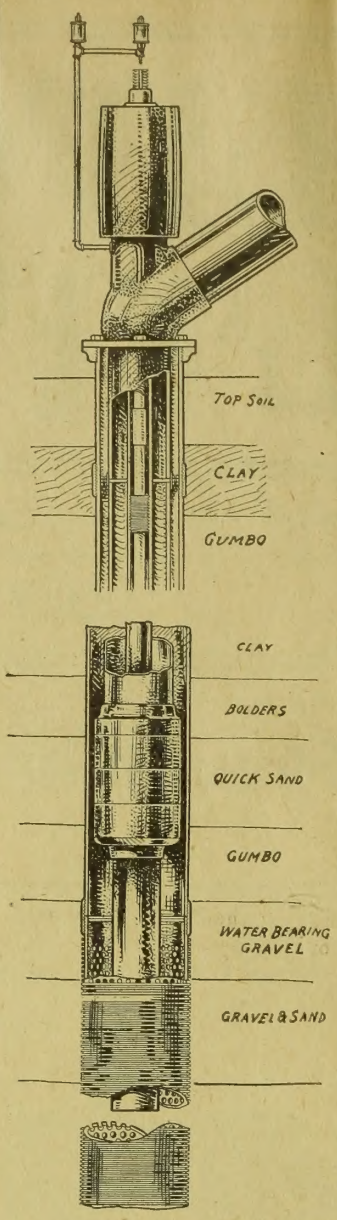


WE are pleased to be able to announce that prompt shipments can now be made of the **New Arnott Cultivator** as shown above. This has been for years the most popular cultivator in the Southwest andwith the **New Fore Truck** it is way in advance of any other orchard tool.

Sold by Leading Dealers everywhere, or write us direct if your dealer cannot supply you.

Arnott & Co. 112-118 So. Los Angeles St. **Los Angeles, Cal.**

EXCLUSIVE MANUFACTURERS



The pump illustrated above is well adapted for all general artesian service. 1¼" and larger in diameter.

California's Greatest Water Developers

We are now developing water for California's largest land corporations on the following tracts.

50,000 acre ranch.
100,000 acre ranch.
Large sugar refinery.
California's largest cattle interests.
Dozens of citrus fruit growers, etc.

We manufacture our own

Pat'd Centrifugal Pump

A scientific water developer that will deliver the maximum amount of water at the minimum cost.

The Layne System Pat'd Pump, Pit, and Screen.

Our new catalogue is ready, don't fail to write or call for it. It contains valuable irrigation information.

Cantaloupe Growing at Brawley, Imperial County

Imperial Valley Recently Sent a Train of 130 Cars, One and One-Half Miles Long

While sitting in the office of the Bungalow Inn at Brawley, Imperial County, recently, I had a few moments' conversation with a man engaged in a very strange business. It consisted in the distribution of millions of bugs. The man was Mr. Frederick Maskew, connected with the office of the state horticultural commission. Mr. Maskew had in hand great quantities of Hipodamia convergens. These little insects with a large name had been gathered in the mountains east of Sacramento, in Placer County, by a force of men connected with the state horticultural commission, and forwarded to the Imperial Valley. This is the third year in which this work has been carried on and it has been an undoubted benefit to the melon industry. The little fellows are simply the ordinary yellowish-red lady-bug with black spots. When released in the field they proceed at once to attack the melon aphis, which has been the bane of the melon industry for some time. This year the aphis has not been so bad, but notwithstanding this the growers have received Mr. Maskew and his bugs with the greatest of pleasure because of past friendship for the bug. In this particular lot Mr. Maskew informed me that there were over eight millions of the insect. They are not dumped in the field promiscuously, but taken to the most desirable location in the field and the box or container opened to allow them to come forth as they will.

The use of bugs to kill bugs that are detrimental to fruit growing and farming has become an established feature in this state. Whether this gathering and distribution of Hipoadamia will be continued remains to be seen, but present indications are that the benefits are great enough to cover the cost.

As to the melon situation in the Valley, Mr. Maskew said that he had covered practically 144 square miles of the melon growing section from Rockwood south to Heber, and that he estimated there would be nearly 5000 acres of cantaloupes which would develop and be marketed. There are almost 3600 acres in the neighborhood of Brawley, which is indeed the center of the melon growing industry. The season is not so far advanced as last year by practically two weeks because of the continued cool weather. It requires the usual warmth of the Imperial Valley to give sufficient sugar and early ripening to a cantaloupe.

By courtesy of Mr. Peter P. Hovley, President of the Brawley Cantaloupe Growers Association, the writer was taken in his machine to the largest shipping shed in the Valley, a couple of miles south of Brawley, and it was indeed a sight to see the crates,

Septic Tank Construction on the Farm

Instructions as Given by the State Board of Health

Incorporated towns and cities are in a position to secure the advice and services of trained engineers to design their sewage disposal works, but the inhabitants of isolated residences, farmhouses and villages cannot always avail themselves of such technical knowledge, hence it is proper that some words of advice should be offered.

Sewage is the waste matter resulting from man's direction of the forces of nature for his benefit, and includes not only the natural human excreta, but also the wastes from the kitchen, laundry, dairy, and perhaps the stable and pigsty (or at least these latter should be included in the consideration of sanitary conditions). Practically all of these wastes are organic matter which must eventually be returned to the simple elements through the processes of decomposition and putrefaction.

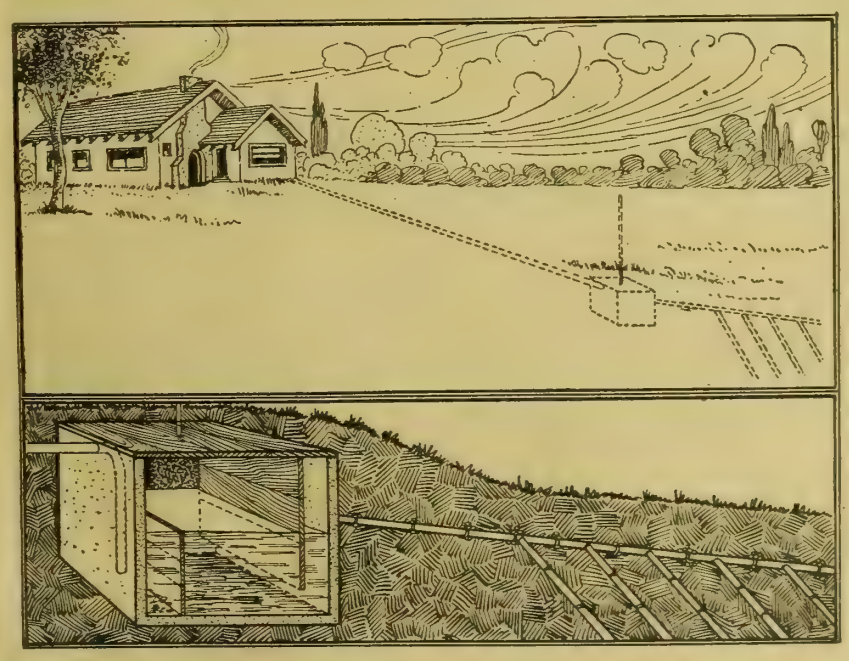
These decomposing processes are effected by the action of minute organisms, known as bacteria. The bacteria which we find so active in breaking down the organic matter in sewage are of two kinds, "aerobic" and "anaerobic." The aerobic, as indicated by the name, thrive and perform their functions in the presence of air and light. They are the cause of the putrefaction of dead animal matter as we see it in the open air, the decomposition of which causes such offensive odors. The anaerobic bacteria (designating organisms that live in the absence of oxygen) work in the dark and away from free air, breaking up the particles of organic matter and dissolving them into their original elements.

It has been found that where sewage is collected in a tank where proper conditions obtain, after a few hours the anaerobic bacteria have attacked the solid matter and separated the constituents. The inorganic matter falls to the bottom while most of the organic matter is dissolved into fluid and gaseous forms. That which has not been dissolved is broken up into fine particles and held in suspension in the liquid. A "scum" forms on the surface of the liquid in the tank which soon becomes dense enough to shut out light and free air. As these conditions become established the anaerobic bacteria acquire their greatest activity. The period required for maximum effect varies with the quality of the sewage, temperature, and other conditions, and ranges from, say, six to twenty-four hours, but eight to sixteen hours is the usual time for ordinary house refuse.

Any person may obtain a quotation in his own community on the materials listed below. To this estimate he has only to add the cost of labor. Cut "A" shows the general arrangement of a septic tank in relation to a farm house or country residence. It also shows the subsoil irrigation method of disposing of the effluent. Cut "B" shows a scale drawing of the septic tank.

Bill of Material for Construction of Septic Tank.

For Concrete Tank—1 bbl. cement, 52 lbs. hydrate of lime, 57-100 cu. yd. sand, 86-100 cu. yd. broken stone, 1 1x12in.x18ft. lumber, 1 piece 1x8in.x10 ft. lumber, 2 pieces 1x12in.x10ft. lumber, 2 pieces 1x12in.x14ft. lumber, 2 lengths 2in.x2ft.6 in. wrought iron pipe, 1 4in. elbow, 1 1x6in. brass nipple, 1 1in. elbow, 1 length 1in.x3ft.3in. galv. iron pipe, 1 1x3in. galv. iron nipple, 1 3x3x⅜in. floor flange (¾in. threaded hole), 8 ft. ¾in. vent pipe, 1 galv. iron weir (see sketch). Form Lumber: 4 pieces 2x4in.x4ft., 4 pieces 2x4in.x4ft.4in., 16 pieces 1x12in.x4ft., 8 pieces 1x12in.x4ft.8in., 8 pieces 1x12 in.x5ft., 2 pieces 1x4in.x4ft.8in., 2 pieces 1x4in.x5ft., 2 lbs. 10d nails.



Plan for Location of Tank.

For Wooden Tank Box—4 pieces 2x4in.x4ft. plank, 22 pieces 1x12in.x 4ft.4in. plank, 14 pieces 1x12in.x4ft. plank, 2 pieces 1x6in.x4ft. plank, 2 pieces 1x8in.x4ft.4in. plank, 2 pieces 1x6in.x4ft.4in. plank, 2 pieces 1x6in.x 4ft.4in. plank, 2 pieces 1x8in.x4ft. plank. Inside walls and top: 1 piece 1x12in.x18ft., 1 piece 1x8in.x10ft., 2 pieces 1x12in.x10ft., 2 pieces 1x12inx14 ft.

Note:—All the above lumber to be of redwood.

The action, called "septic," does not completely dissolve the matters contained in the sewage, but under proper conditions should destroy 40 to 60 per cent of the organic matter, leaving the remainder suspended in a fine divided state. The effluent from the tank will, therefore, be putrescible and if exposed to the air in stagnant bodies will soon become offensive. To avoid the offensiveness the effluent is disposed of by turning it into streams of running water which is a dangerous practice, or by using it for irrigation, either on the surface or in subsurface tiles, (Subirrigation is not successful, however, unless the soil is of a sandy nature) or by further treatment. This further treatment consists in spraying the liquid effluent from the tank out through the air over "contact-beds" prepared of rough rocks and coarse gravel. The purpose of this process is to get the effluent aerated and in contact with the "aerobic" bacteria.

When properly constructed none of these methods need require much ex-

Citrus and Tropical Fruits

THE AUSTRALIAN ORANGE TREE.

By Chas. R. Paine.

By invitation of Chas. A. Dewey of Upland I visited a few days ago orchards there in which he is working to transform the so-called Australian navel orange trees to true Washington Navels.

The character of the former sort, seen here and there in a grove of the latter, is distinctively marked by greater dimensions both in height and breadth and by more openness of the branches which extend upward obliquely, contrasting with the pendent tendency of the branches of the true navel orange tree. The foliage also is distinctive.

A feature of many trees, supposedly of the regular navel type, he pointed out, was to have, in some cases, the topmost branches of the Australian type; in others, in addition to the modified top, an extension of this sort of branch and foliage to branches next below; again, other trees would show the change still lower down, and unless such change from the true type was arrested, the whole tree would become the well-known Australian orange tree, produced, not from bud variation in the original nursery form, but by deterioration in orchard growth from what was at first the regular desirable variety.

His contention is that this is the tendency of the Washington navel orange tree. He finds that when observation of a certain orchard, for instance, is made, a limited, definite number of such inferior trees (Australian) may be found by anyone at all acquainted with orange culture; in these trees rebudding may be done and the tree be changed to the normal kind. Later, to the surprise of the orchardist, several other trees of the objectionable sort may be discovered, and after very careful observation to make sure that all are included, he rebuds the second lot; again, after a further interval, more Australians appear and he is forced to conclude that a change in the character of the trees is going on, not merely that change indicative of age, but an active, vigorous growth different from that which belongs to the Washington Navel, bearing fruit of an inferior quality.

He was working at the time of my visit in an orchard of large old trees, rebudding those which were wholly Australians, and cutting out from other trees all those parts which had taken on the Australian type, having learned by long and close observation the features of branch and foliage indicative of the changed condition; sometimes it would seem to a bystander that he was destroying branches of the regular sort.

The deterioration from the Washington Navel to the Australian is brought about, he observes, by limbs growing upright or nearly so, originating as suckers on the trunk, and growing above the pendent branches, such limbs ultimately dominating the tree.

His theory is, though I did not get an exact expression of it, (and I mingle my own view with his to form a theory) that the upright strong growing branches by their leaves elaborate a plant food of a peculiar quality which, supplied to the other parts of the tree, changes them in wood and foliage, in the course of years, to a likeness of the upright growth of the so-called Australian navel orange tree, unscientific, probably.

I have not myself observed such changes of type gradually proceeding, nor noted an increasing number of Australians from year to year; had I formed the habit, as I should have, of rebudding all trees of inferior fruiting qualities, I should be in a position to know personally the truth of this matter.

This is true, however, as all orchardists know, that sucker growth, in the early years of its fruiting, especially, bears fruit of a thicker skin and coarser texture, corresponding with the rankness of the growth of the wood, and that such growth if it comes from the trunk becomes the strongest part of the tree and overhangs and dominates the proper fruiting wood; and, if it comes from a branch, it weakens and ultimately destroys that branch.

For the sake of maintaining high quality of fruit there is no doubt that such growth should be kept down, and that only pendent branches should constitute the tree to be at its best as a profitable fruit tree. To this end it is important that young orange trees should be allowed to increase in size chiefly by the slower formation of small fruiting branches instead of sucker growth, or even upright growth on the branches.

If due attention is given to these particulars in all stages of orange tree formation, such a condition as Mr. Dewey finds could not result, unless, as is commonly thought, the original bud, a mutation, is at the bottom of the tree form and character called Australian.

The highest type of the navel orange tree found by Mr. Shamel of the Department of Agriculture in the orchards of the National Orange Company at Riverside is composed wholly of pendent branches so growing and fruiting that the openness of the down-hanging limbs permits a large proportion of the fruit to form inside.

To make an opening by way of the top into the interior of orange trees in order that growth of fruit wood may take place where long stretches of limbs in old trees have been bare, or the abiding place of dead brush, or the home of suckers, also has the effect of keeping in abeyance the vigorous upright growth which Mr. Dewey finds is detrimental to the character of the tree as a whole and to its fruit.

On his own home lot in Upland he showed me trees which, he said, had the Australian tendency; these he had treated three years before, not by rebudding. These trees are now of the normal rounded form entirely free from growth of sucker origin. The tops, however, are entirely closed, and they are, in consequence, fruiting but little within.

Mr. Dewey's work in Upland and Pomona is quite extensive in altering trees, and of much interest, and worthy of investigation. If it teaches no other lesson than the value of regulating the growth of the branches so as to secure better quality of fruit, it is worth while.

Another sugar factory for Southern California is in prospect in the Hynes-Clearwater district.

FERTILIZER REMOVED BY ORANGE CROP.

In order that we may fertilize intelligently we should know the amounts of the fertilizing elements which are removed from our soils in the fruit we send away. A further knowledge of the nature and behavior of our soils is required to guide us in this respect. Finally we should make due allowance for the plant food that is lost through leaching.

We find that in an average crop of 300 boxes of 80 pounds each, per acre, there are removed from the soil 34.4 pounds of ammonia (equal to 28.3 pounds of nitrogen), 12.7 pounds of phosphoric acid, and 70.3 pounds of potash.

This loss could just be supplied by 138 pounds of sulphate of ammonia (analyzing 25 per cent), 79.5 pounds of acid phosphate (analyzing 49 per cent), and 143.5 pounds of high-grade sulphate of potash (analyzing 49 per cent).

The fertilizing constituents removed in the fruit do not represent the total loss of plant food from the soil. We must take into consideration two other sources of loss: the material used in the production of new wood, leaves and roots; and that lost from the soil by leaching.

The following is the number of pounds of ammonia, phosphoric acid, and potash, in 1000 pounds of leaves and 1000 pounds of wood. In the leaves are 8.5 pounds of ammonia, 1 pound of phosphoric acid, and 4 pounds of potash; in the wood there are 8.5 pounds of ammonia, 5 pounds of phosphoric acid, and 7 pounds of potash. As may be seen, the tree draws most heavily upon the ammonia and potash. However, after the tree reaches maturity the loss of plant food from the soil due to formation of leaves and wood would be relatively small.

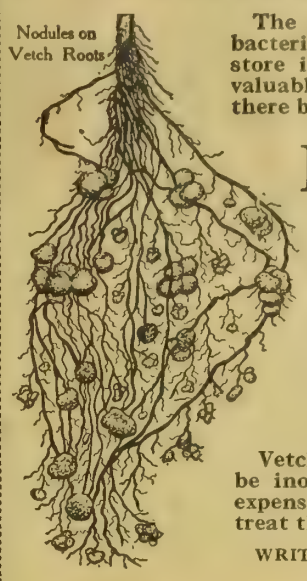
The loss by leaching falls most heavily on the ammonia, and is greatest when applications of nitrate of soda are followed by heavy rains. In open sandy soils the loss of phosphoric acid and potash must also be considerable. Should we have a continuous heavy rainfall—say 4 to 6 inches — soon after fertilizers have been applied, much more of plant food would be leached out, and carried beyond the reach of the roots, than if this same amount of rain had been distributed over a period of several weeks. On groves where we have a cover crop established during the rainy season, the loss would not be so great as it would where clean culture is the rule; since the network of roots would tend to check the downward movement of the water.

It is impossible to form an accurate estimate of the loss from the last two causes; but that more or less is sustained is evident, and it must be taken into consideration when we decide upon the quality of fertilizers to be applied. No doubt in many cases this loss could be reduced without harm to the crop by a judicious use of more humus-forming materials, and thus the cost of fertilizing would be lessened.

An average crop of cotton consisting of 200 pounds of lint and 654 pounds of seed per acre would remove from the soil 25.3 pounds of ammonia, 6.8 pounds of phosphoric acid, and 9.9 pounds of potash. Nearly all this is in the cotton seeds, there being only 3.3 pounds of fertilizing ingredients in the 300 pounds of lint. It is assumed that the body of the plant is returned to the soil. It is apparent that the orange crop draws much more heavily upon the soil than does the cotton crop.

Analyses of eleven varieties of Florida oranges show that every ten boxes, of 80 pounds each, contain 1.2 pounds of ammonia, (equal to .96 pounds of nitrogen), 4 pounds of phosphoric acid, and 2.32 pounds of potash. With these figures at hand it is easy for us to calculate the amount of fertilizing constituents removed per acre in a crop of any size.—Florida Agriculturist.

Fertilize With Air



The nodules on these roots are colonies of bacteria that suck the nitrogen from the air and store it in the plant, which then becomes a valuable fertilizer. The bacteria were placed there by inoculating the seed with

FARMOGERM

(High Bred Nitrogen Gathering Bacteria)

Science has thus brought the wonderful possibilities of bacteria fertilization to a thoroughly practical and simple method of application.

This places within reach of every grower an enormous increase in the tonnage and fertilizing value of

COVER CROPS

Vetch, clover, fenugreek and all legumes can be inoculated with Farmogerm at a nominal expense and by a simple operation, or we will treat the seed for our customers if preferred.

Deciduous Fruit Culture

DISEASES OF ECONOMIC PLANTS.

Always up-to-date in the publishing of the latest and best pertaining to agriculture the MacMillans are now out with "Diseases of Economic Plants," written by F. L. Stevens, Ph. D., Prof. of Botany and Vegetable Pathology of the North Carolina College of Agriculture, and J. G. Hall, M. A., Assistant in Vegetable Pathology North Carolina Agricultural Experiment Station. The book is published at $2.00 net ,and is a most valuable reference book for any library. In the Preface it says:

"Students of plant disease are naturally divided into two categories. First, those who wish to recognize and treat diseases, without the burden of long study as to their causes; second, those who desire to study the etiology of diseases, and to become familiar with the parasites which are often their cause.

"The present book is designed to meet the needs of the first of these two classes of readers. It indicates the chief prominent characters of the most destructive plant diseases of the United States, caused by bacteria or fungi, in such a way that in most cases reliable diagnoses may be made, though it must be recognized that in some cases certainty cannot be had without recourse to microscopic details. Information is given regarding the best methods of prevention or cure for these diseases."

The Introductory gives the subdivisions of plant pathology as follows:

"1. Those caused by cryptogamic parasites, fungi, bacteria, and slime molds.

"2. Those caused by parasitic flowering plants.

"3. Those caused by animal parasites, insects, worms, etc.

"4. Those due to adverse inanimate environmental conditions, light, water, soil, nutriment, etc.

"5. Physiological diseases due to other internal derangement."

The history of the science of plant diseases is the first feature of the book, even going back so far as the Old and New Testaments in which blights and mildews are referred to. Aristotle's reference to them 350 B. C. is mentioned. These, of course, are merely interesting statements given in shortest of space; more particular attention is given to the development of the last half century. A photograph is shown of Millardet, father of the Bordeaux mixture, and in connection is an illustration of "An improved brush for distributing Bordeaux mixture." A valuable chronology of important events in plant disease history is added.

Ground disinfection is given several pages. Referring to peach leaf curl the book states: "Throughout the peach producting regions this disease abounds, being particularly injurious in moist localities. The annual loss by it in the United States approximates $3,000,000.

The book treats of practically all diseases which have visited the agriculturists of the Pacific Coast; blue mold of the orange, brown rot of the lemon, and other familiar troubles are given due space.

We can take a little exception to the walnut blight feature of the book, it states that this causes the loss of 50 per cent of the crop of the Pacific Coast, to which it is peculiar. A short description is given, then a short paragraph which says: "Two treatments with Bordeaux mixture, after thorough removal of diseased parts, have been known to prevent 50 per cent of the loss. The second spraying should be given when the nuts are firmly set. Care should be taken to select resistant trees for propagation.

The last sentence of this paragraph is entirely correct, but if any walnut grower has been able to prevent 50 per cent of his loss by the use of Bordeaux he is yet to be heard from. However, in justice to the authors we will say that a foot note puts the responsibility for this statement on the "U. S. Dept. Agr. Year Book, Page 98, 1904."

All told, it is an excellent book which the Cultivator office will supply to its readers or it may be had by addressing The Macmillan Co., 56 Fifth Ave., New York.

GATHERING COTS.

In an exchange we note the following which may be of value to apricot growers who gather for drying.

Three men working together, two of them using fish poles, cut off at the tip to about the size of half an inch, with hooks attached, made of half-inch oval iron, with four inches of it turned into the hook, the oval side on the inside of the hook, which is lashed on the pole with a strong cord, with melted asphaltum poured on it to prevent it from slipping.

To use the poles, hook on the limb and pull down slightly, with short jerks—or quiver—this will remove the ripe fruit but not the gren. Place two sheets, made of heavy drilling 12 feet wide by 24 feet long, one on each side of the tree. After shaking the fruit onto the sheets two men take hold of the corners and roll the fruit to the center, then each of the two men go to the middle of the long way of the sheet and raise it up in the center sufficiently to make the fruit roll out when the third man places an empty box at the end and pulls the sheet tight so the fruit will roll into the box. When both sheets are emptied two men take hold of the two corners and turn it bottom side up, which empties the leaves and sticks on the ground ready for the next tree. It is a good plan to distribute the empty boxes between every other row of trees so the third man can get them handily.

MAKING CIDER ON THE FARM.

Good cider can be made on the farm in small or large quantity without much apparatus, but as a matter of fact it is seldom so made. The reason for this is lack of attention to details. Only good fruit will make good cider. It is not worth while to waste effort on poor, unripe fruit, or on early fruit with thin acid juice weak in sugar. The finished product will never be better than what one starts with. Unmerchantable grades of our very best table fruits should be used for home-made cider. Some of the crabs showing good sugar content, as Maiden Blush and occasionally a good seedling apple, make the very best cider, because of the tannin found in them.

The fruit should be clean and free from rot. To use unclean or decayed fruit simply invites bad fermentation. If one puts into the cider all sorts of germs found on soiled, dirty and decayed fruit, he should not expect good

results. The fruit should be carefully pulped when it is cool, the juice expressed as quickly as convenient and put at once into clean barrels. Great care should be used in selecting a grinder. Proper machinery will recover four gallons of juice per bushel. Mills made with stone rollers will crush the fruit so that four gallons of juice can be recovered by hand.

Having secured the juice, a proper barrel is all-important. For drinking cider, use only perfectly clean alcohol or whisky barrels. Never use a barrel that has contained cider or any other liquors than those mentioned above. An old cider barrel cannot be properly cleansed. Barrels should be thoroughly scalded with boiling water and washing soda, then rinsed clean with cold pure water. Put the barrels, if possible, in a room where the temperature will be fairly constant at 60 per cent to 70 per cent. Lay flat, and fill with juice to within ten inches of the bung-hole. Cover the bung-hole carefully with clean cotton, so as to exclude the entrance of germs and vermin. This cover readily permits the gases to escape. Never allow it to touch the liquor in the barrel. It is a great mistake to allow the barrels to foam over, as all sorts of germs enter under such circumstances and destroy the cider.

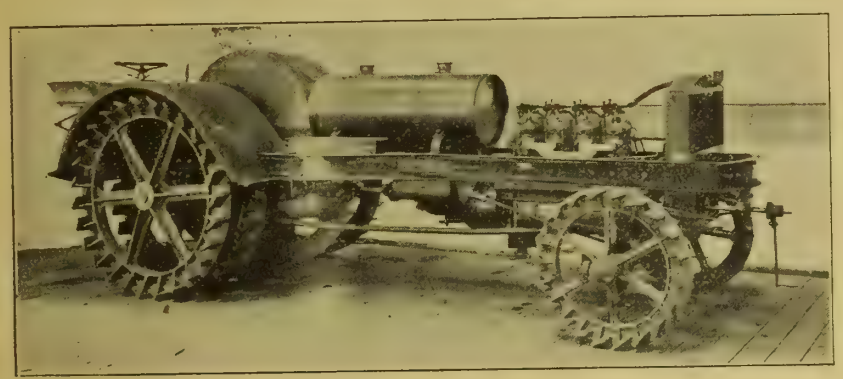
As soon as the juice is in the barrels, put into it a cupful of good yeast or, what is better, a pure culture of special cider yeast. This sets up the alcoholic fermentation at once and largely cuts off the development of harmful organisms. Fermentation will be more rapid by this method. After three days, raise the cotton and note the condition of the head on the cider. It should become thick and turn dark as the first fermentation is completed, but one cannot predict with certainly what will happen in this regard. As soon as the liquor becomes comparatively quiet after this fermentation, it will be found fairly bright and limpid. It should then be racked off into a perfectly clean barrel and every care observed not to carry over any of the lees. This barrel should be kept at a temperature of 55 to 65 degrees. The bung-hole must be carefully guarded as before. A second fermentation will now set in, and as soon as it subsides the barrel can be tightly bunged; if kept in a cool cellar, the cider will keep for several months.

No liquor of such low alcoholic strength as cider will keep if exposed to the air, and air and vinegar germs will find entrance sooner or later. If one is not afraid of using chemicals, one can treat each barrel with about 2½ ounces of benzoate of soda and keep the cider for a long time for further change. It is far preferable, however, not to use chemicals, but to watch the cider as fermentation progresses, and when it shows specific gravity of 1.004, rack it free from lees into sound, clean wine bottles, cork tightly and store in a cool cellar. It is always best to tie the corks down. The bottles should be laid flat. There will still be some slight fermentation, which will render the cider sparkling and agreeably gaseous. Good cider, cleanly made and preserved in bottles, is a most wholesome refreshing drink, and especially to be recommended for dyspeptic and gouty persons. I have drunk bottled cider twelve years old. I make this for my own use. Of course when made for vinegar, so much care is not taken.—Country Gentleman.

A POWERFUL TRACTOR AT LOW COST

You Need It Your Neighbor Needs It Everybody Needs It

Simple in Construction — Easy to Operate



This 30-Horse Power Tractor

is especially adapted for ***General Farm Purposes.*** Pully for Pumping, Sawing, Threshing, or any and all power purposes is attached on shaft where crank is shown.

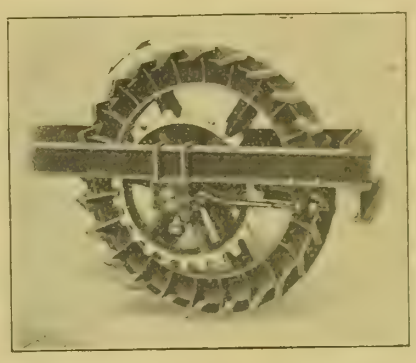
Mr. Farmer:——Mr. Orchardist:

You will agree with us that the better you can till the soil, and till it when it should be, which is usually when it is too hot to get best results with the horse, the greater your profits will be. ***Have You Stopped to Consider*** what it costs to plow, cultivate, etc., with high-priced horses, working them 90 days and feeding them 365. True, until the present you have had no alternative, but the ***Johnson Tractor*** is especially designed to meet the requirements of the farmer and orchardist.

We call special attention to our

Tractor Wheel

which gives the greatest possible traction, does not clog, slip or ball up, and no possibility of shaking to pieces like a built-up wheel, and, best of all, does not pack the soil.



Our Tractor Engine is constructed throughout of the very best material and every part is thoroughly tested before being assembled.

We Want to Tell You More About This Powerful Engine and Show You How It Will Earn You Money. Our Catalogue tells a Story Full of Facts and Figures of Living Interest.

We know you will find this Tractor the most convenient, practical and economical power to be had for any and all farm purposes.

Be Sure to Send for It. Mailed Free. Write Today. Address

Johnson Tractor Co., Sunnyvale, California

Farm Land to Rent

at $5.00 per Acre, or One-Quarter Share

First-Class, Level Land, Suitable for Grain, Alfalfa, Vegetables or any Other Crop. One Acre Produced 15 Tons of Onions.

Water in Abundance from Artesian Wells

That Flow 100 to 150 Miner's Inches Each

Located 7 to 12 Miles Westerly from Wasco and Elmo on Santa Fe R. R. in Kern County, California

10,000 Acres will be leased with option to buy at $100.00 per acre when option is desired, in tracts of any size required by tenants. Residents on the property will be given preference of employment on improvement work and farming to be done by the Company.

INVESTMENT

Treasury Stock of the Company at par, $1.00 per share, based on a valuation of $50.00 per acre, can be purchased for cash or on time, cash to go into improvements. This is **the chance** if you are looking for a land investment. Write for particulars.

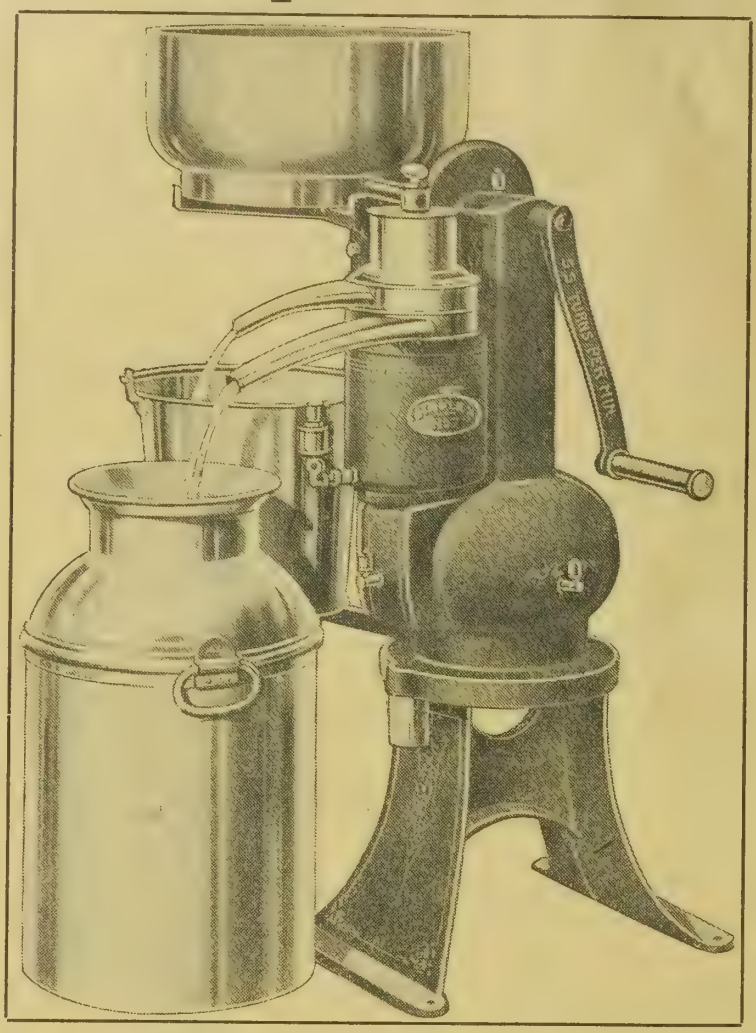
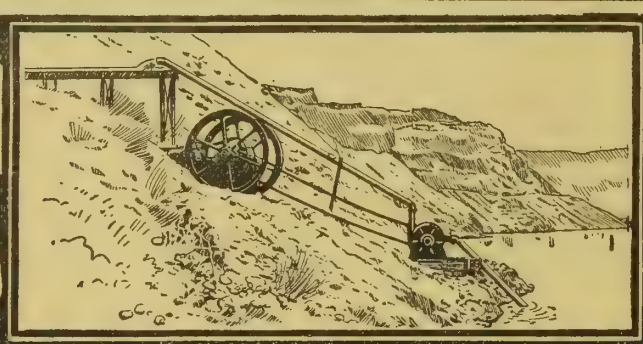
Simplex Cream Separator



If you are in the market for a Cream Separator ***write us.*** We have all sizes and styles, also a few good second hand machines. We carry a full line of Creamery Supplies.

O. J. WEBER 225-227-229 East 6th St. **Los Angeles**



Have Your Own Independent —Water Supply System—

SOIL that will yield crops with a meager supply of water can often be made to yield two or three times as much with plenty of water. Government experiments have proved this beyond a doubt. Just think what this means—more crops—better crops—the choice of crops—all within your reach with the help of an

I H C Gasoline Engine

It will guarantee you a sure water supply—in fact a water supply that is even better than rain as you can have as much water as you need at just the right time. You won't have to wait for rain and watch your crops dry up in the field. An I H C engine is dependable and the cost is so small in comparison to what you can make that the extra profits the first year will often pay for it. In addition to your irrigating this same engine can be used for general purposes.

I H C engines are the most efficient and economical power known for pumping, grinding, and other farm work and are made in so many sizes and types that you can get just the engine you want for your special needs.

Vertical type—2, 3, 25, and 35-H.P.; horizontal—1 to 25-H.P.; semi-portable—1 to 8-H.P.; portable—1 to 25-H.P.; traction—12 to 45-H.P.; sawing, pumping, spraying, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new catalogue.

I H C Service Bureau

The Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problem to the I H C Service Bureau.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE REGISTERED BULL.

A Tennessee subscriber asks if we will give him some concrete facts as to the superior selling value of those cows that have been sired by a registered dairy bull. Fort Atkinson is situated in Jefferson County, Wisconsin. This county is noted for its Holstein and Guernsey cattle. The yearly sales of cows and heifers, both registered and grade, mostly grades, amount to nearly $700,000. Parties come here from distant states and pick up these cattle by the carload. From this city alone 350 carloads were sent out last year. Now, the value, in the minds of the buyers of these cattle, is their breeding. No one comes here to buy natives or scrub cattle. High prices are sometimes paid for very desirable grade cows.

One farmer who had been very particular about the quality of the bulls he used, sold, last fall, seven grade Guernsey cows to an Iowa buyer for $125 each and he would not have taken this price even, had it not been that he wanted to dispose of his grades to make place for a lot of registered heifers that were coming on. The seven cows thus disposed of averaged over 350 pounds per cow a year, of butterfat at the creamery.

While this is an exceptional case it shows what value a highly bred dairy bull will put into grade cows when the breeding is united with skill in selecting and feeding. Taking them as they run we will say that grade cows and heifers sell here for from $15 to $25 more than ordinary native cows will bring.

The problem is a plain one. The buyers come to this and other counties in Wisconsin to buy these cattle because so many of the farmers have had the good dairy and commercial sense to buy and use registered bulls. But the bull cannot do it all. The farmer must use additional good dairy sense in feeding and developing the heifers, so that they will make good cows. The cow must have a fair chance when a calf and up to and through her first milking period, to develop the qualities her sire has given her. There are too many short sighted farmers on this important point even in this great dairy section. As a rule they are men who read and study the cow question but little, thinking that "main strength and awkwardness" will do the work. But they are not the farmers who get the best prices for their cattle even though they may use registered bulls.

Another prime cause for the rearing of good dairy cattle here is the fact that most of the milk of our cows goes to creameries, either in the form of whole milk or cream separated on the farm. This gives an abundance of skimmilk with which to rear the calves. There is no other way as good to rear good heifers that will make good cows.

And further, those farmers that stick to the creamery and produce these high-priced heifers and cows make the most money. They make it in three ways:

1. By keeping planty of young stock on the farm, the manure supply is greatly increased and the producing power of the farm is better kept up.

2. In raising a yearly supply of heifers from good bulls they supply their own herds with much superior cows, thus greatly increasing their milk product. There is no denying that a heifer well raised on the farm will make a better cow than one bought outside.

3. In the sale, at good prices, of the surplus heifers and cows.

This constitutes the ideal dairy farming, both for the sake of the farm, and its fertility, the final cash profit to the farmer and the general prosperity of the community. As will be seen, the whole is based upon the use of the well-bred, registered bull, and his reflex effect upon the mind and development of the farmer. The production of well-bred farm stock calls for farmers of active brain, who see things in their right light and meaning and who keep up their mental power as well as the quality of their herds.—Hoard's Dairyman.

SUCCULENCE AND SILOS.

It is essential for large yields and economical results that some succulent foods be given the herd during the winter months. This can be supplied either through the use of root crops or by using silage from different sources. Roots are a useful form of succulence, but the cost of labor necessary to grow them precludes their general use in this country.

In view of the fact that corn yields digestible dry matter more abundantly, with a reasonable expenditure of labor, than any other plant, its use in the form of silage is general. Corn silage is especially suited to all intensive operations where it is necessary to supply as many animals as possible on a small amount of land. Like the plant from which it is made, corn silage is carbonaceous, yet its succulence stimulates milk secretion to a marked degree, and its generous use in winter is the best way to approach ideal summer conditions.

Clover, alfalfa and cowpeas may be fed in the form of silage, but their use in this manner is not common. If the planting of cowpeas is so timed that they will reach maturity when the corn crop is ready for the silo, one load of green peas to two loads of corn will make excellent silage and overcome the risk and labor of curing the cowpea hay. The silo is a necessary part of the equipment of any well-regulated dairy farm, and its value is highly appreciated by feeders of all forms of live stock. No dairyman who has ever made and fed silage properly would forego the advantages offered by it.

They contend that it is essential to success. Too much cannot be said by way of inducing farmers to use silos more extensively. Instead of wasting one-third of the nutrients of the corn crop each year by allowing the clover to waste in the fields, the whole crop should be converted into silage and fed to dairy cows in well protected stables and yards. The returns from the increased production of milk would add millions of dollars annually.

No Hoof-No Horse

Statistics show that 80 per cent of all horses are lame, and that 80 per cent of the lameness is caused by hard and contracted feet. Especially is the dry season in this section very hard on hoofs. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for tender, brittle, hard and contracted hoofs, split hoofs, quarter cracks, mud fever, scratches, corns, cracked heels, grease heels, and for all kinds of sores and cuts anywhere on any stock. It will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Send for Folder with many testimonials of big horsemen, vets and others. Or better accept our

IMPERIAL PACKING HOUSE.

While at Imperial recently we had the pleasure of being shown through the yards and the packing house, which is becoming a factor in the welfare of the Imperial Valley. Mr. Geo. O. Love is the manager in charge. This is not an extensive proposition, but in a way means much to the prosperity of that community. It handles 40 to 50 cattle weekly, 30 to 35 hogs and 40 sheep. In the yards or pens are now some 1300 hogs fattening. As soon as government inspection can be secured a material extension of the business is anticipated. At present the capacity of the house is not large because of limited markets, but at this time a large scope of country east of Colton and west of Phoenix is being reached. This concern affords outlet for much of the stock which is being fattened on the rich pastures of the Valley, and in addition ships many live fat stock to larger markets. We believe it is an example of what might prove a most advantageous move in many other communities.

The greatest feeding value in skim milk is always found in feeding it to young animals.

Education and high milk yield go hand in hand.

Veterinary

Worm Powder.

Please give a remedy for worms in horses. A powder which can be given in the feed is preferred.—R. C. F., Los Gatos.

A good tonic powder which is also a fairly reliable remedy for worms is made by mixing dried iron sulphate 3 ounces, pulverized nux vomica 3 ounces, pulverized gentian 5 ounces and bicarbonate of soda 5 ounces. Give a tablespoonful of the mixture three times a day in the feed.—F. G. M.

Udder Caked.

The udder of a mare was badly inflamed at foaling time. Treated with hot water and olive oil, and the swelling reduced, but at present, two weeks after foaling, it is still caked, though not painful when rubbed. Please prescribe.—Subscriber, Gardena.

Mix vaseline 8 ounces, zinc oxide 2 ounces, belladonna ointment 4 ounces and apply once daily with prolonged but gentle hand rubbing.—F. G. M.

Scratches.

A mare eight years old has scratches on the hind leg, above and under the pastern joint. There is some swelling, and there are four raw surfaces which scab over, but when washed these scabs come off. When the animal is worked she shows a little stiffness the first few steps, but no other evidence of pain.—Subscriber, Los Gatos.

Have your druggist prepare an ointment composed of amber petroleum one pound, zinc oxide 4 ounces and cerate lead subacetate 2 ounces. Apply this ointment freely once daily after gently removing scabs and accumulated dirt with a soft, dry cloth or cotton.—F. G. M.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

The Ornamental Garden

THIS MONTH.

It is time to begin planning for winter flowers such as pansies and stalks, and these may be planted this month. Shasta daisies which are now a glory of white and gold must be given plenty of water and liberal cutting indulged in if the blossoming season is to be prolonged. Gladiolus and other summer bloomers require quantities of water at this season. In fact, all the garden must be kept thoroughly moistened as well as the lawn. Chrysanthemums should be kept thoroughly suckered or if the growth has been too rank, topping back may be advisable and large side branches should be removed extensively if large blossoms are desired. Some people, however, prefer the smaller blooms and greater quantity and it must be confessed the smaller flowers make a very handsome effect.

Rose bushes which have bloomed profusely during the past few weeks may now be hardened down by depriving them of irrigation until the branches of the size of a lead pencil begin to shrivel. Then heavy cutting off of this wood and all needless branches and thorough irrigation followed by fertilization will give a world of bloom a few weeks later.

It is now time to plant eucalyptus, acacias, and some other ornamentals. Blue gums, which grow so vigorously, should perhaps be held off until the last of the month or they will become too large before transplanting time comes in the spring. The best way is to plant these in the small "flats" such as the nurserymen use.

NEW ROSES FROM SEED.

By E. Benard, in the California Garden

In view of the announcement of a thousand dollar prize for a new rose for the Panama-California Exposition, it should be of interest to briefly consider how new roses arrive. Like babies, they are for the main part born of two parents, and the mixture of blood produces an offspring unlike either. The pollen from the male bloom fertilizes the female organ in the other, and nowadays this cross fertilizing is done by hand with the aid of a camel's-hair brush, and is not left, as formerly, to the uncertain ministrations of bees and other insects, when the saying that "it is a wise child that knows its own father" applied fitly to roses. Here in California roses ripen seed so readily that we ought to have a magnificent family with musical Spanish and Indian names. Rose seeds are uncertain in sprouting, some coming at once, others waiting a year, but best results are obtained with fresh seed. The seedlings want careful transplanting till they begin to grow, and are subject to mildew and rot, and the very vast majority revert to the wild single type, but new roses keep coming, and this is the way they come.

The question is often asked as to how to treat rose seeds. It is safest to plant in boxes, so as to be able to care for the little plants. Rose seedlings do not come up of themselves under our rose bushes, showing that in the open ground conditions are not favorable. Plant in boxes, keep moist and in an even temperature, and resolve to be patient. The seed, it would seem, should come from Kaiserin Augusta Victoria or one of the Cochets, preferably the former, as it is of better habit of growth. The Cochets are the crabs of the rose family, they move sideways, they must sprawl. Kaiserin crossed by Joseph Hill, Sunset, or even William Allen Richardson, should produce the yellow rose we lack so much.

SUCCESS IN GROWING PLANTS.

It is not so much special treatment, professional secrets or even knowledge that makes the successful grower, so much as love for the plants and interest in the work. Experts with all kinds of facilities and knowledge have failures, but the gardener who loves his plants, who can understand their language and can cater to their wants, does not fail with them without knowing why. To the thorough gardener the language of plants is as easily understood as the spoken word. To the trained eye their cry for water at the root or in the atmosphere, their protest against uncongenial temperature, is as plain as it can be. More food, too much food, sour, undrained soil ("cold feet," as the gardener calls it), more light, too much light, are calls the gardener must heed. In the vernacular, "get next" to the plants.

The successful greenhouse man does not need a thermometer to know the temperature of his greenhouses; the moment he steps inside of the door he "feels" whether the conditions are right or wrong. It is not only the temperature, but the moisture combined with fresh air that produces the atmospheric conditions. Even in the dark he knows if his American Beauties are happy, or as he steps into the carnation house if the plants are being too hard-worked, with no time to properly develop their bloom, or if the air is stagnant, encouraging disease among his pets. So it is in the dwelling house or out-of-doors. Learn the sign language of the plants and you will be one with them and know how to make them happy.

It is to this keen perception and knowledge of plants that we owe the great improvement of our cultivated varieties. New plants are not produced over night. Each one is a record of long patience, close observation and intense interest. The first indication the plant gives to its master of possible improvement would be unobserved by the many. Perhaps it is only a little deeper color or a slight variation in the form and texture of the flower or foliage that marks the first deviation from the regular type, but to the expert it is a loud cry of great possibilities.

A few hours in a garden with such men as the late Thomas Meehan opens up new worlds and shows what makes men masters in their professions. It is not so much profound learning as having eyes that see and a mind that can understand the language of the silent kingdom.—Ernest Hemming in Meehan's Monthly.

Men hurry to and fro in search of truth and are unconscious that it shines over them with the luster of a fixed star if they would keep silent for a little and let the air clarify itself and the heavens become visible once more.—Hamilton Wright Mabie.

Public Land Scrip

Absolute Title secured without

SETTLEMENT
RESIDENCE or
CULTIVATION

by the use of scrip. We have scrip that will take Government Lands in California.

Title guaranteed or money refunded. It's the guarantee that protects the buyer.

We can furnish on short notice—

Soldiers Additional,
Recertified Soldiers Additional,
Forest Reserve,
Valentine,
Sioux Half Breed.

We Carry More Scrip

on hand ready to apply at a moment's notice than any other dealer.

1 Queen, 75 cents;
10 Queens, $7.00;
50 Queens, $32.00;

Larger quantities quoted on application.

M. H. Mendleson Piru, Cal.

Small Fruits and Vegetables

THIS MONTH.

Irrigation is an especially important factor in the garden work this month. Light sprinkling has ruined many crops because of spraying over the foliage in the heat of the day, and in addition not soaking the ground to the depth one often thinks. Furrow irrigation is the best where it can be followed and for this reason garden planted in rows will be easier to handle. When irrigating, let the soaking be thorough and the cultivation equally as thorough after the soil is in good condition.

It will be in order to plant casaba melons, squash, both green and lima beans, and later tomatoes. Of course, it is always in order to plant cabbage, cauliflower, radishes, lettuce, onions and beets. In planting at this time it is almost necessary to put over the seeds a light mulch of strawy manure as this prevents crusting of the soil which is sure death to the sprouting seed. In the absence of manure an old burlap sack laid over the ground is an aid. If the ground is not moist enough to bring the seeds through, sprinkling may be done through these sacks. If weeds or sticks are laid under the sack to allow the seeds to make a little growth before taking the sacks away there is less liability of burning the young leaves. It takes more skill to grow garden at this season of the year than in the spring, but results will amply compensate.

OKRA.

This is a crop exceedingly profitable when it can be put on the market early. It has no great food value, and will hardly become an important commercial product except where it can be utilized as a canned product in connection with other vegetables. It has been grown in the Southern states for many years, and is used especially for flavoring soups and preparations wherein meat forms an important part, and to these it adds a very pleasant taste. Some people may not enjoy the flavor of okra at first, but after eating a few times of dishes containing it, a taste for it is acquired.

The soil best adapted to okra is a rich mellow loam. It is a typical sun plant and requires warm weather to grow it. When it is once thoroughly established it makes a rapid growth and requires a great deal of plant food to sustain it. Quick acting commercial fertilizers will aid its development very materially.

The seed are slow to germinate unless the soil is warm and moist. The seeds are planted about like corn in rows from three to four feet apart. Where a stand is not secured from failure of the seed to germinate, vacant places may be filled by transplanting. Cultivate about like corn or cotton, using care to keep the soil well stirred, especially while the plants are small. After the plants get up from two to three feet high, little cultivation will be required except to keep the land free from weeds. It is a great drouth resister, and it will continue to bear until frost if the pods are not allowed to ripen on the stalk. As the pods are the only part of the plant used for food, the continued growth of the plant should be secured in order to produce the greatest quantity of marketable pods.

Harvesting.

As soon as the plants begin to set fruit the pods should be gathered daily, preferably in the evening. The flower opens during the night or early morning, and fades after a few hours. The pollen must be transferred during the early morning, and the pods thus formed will usually be ready to gather within thirty-six hours. The pods should always be gathered while they are still soft and before the seeds are half grown.

Besides the uses to which the okra pods may be put in the green or fresh stage, they are often dried and preserved to be used during the part of the year when a fresh supply cannot be obtained. There are several methods of doing this. By one of these the pods are cut into slices crosswise and about one-half inch thick; the slices are then spread upon muslin covered frames and dried, after which they are stored in thin bags until required for use. By another, and a more common method, the young pods are strung upon coarse threads and hung up to dry. In Turkey alone there are tons of the pods preserved in this way annually. This has grown to be quite a commercial crop in Turkey. It appears to me that it could be made an important one in this country. The trade would gladly aid in extending its use as a dried product.—Bulletin 232.

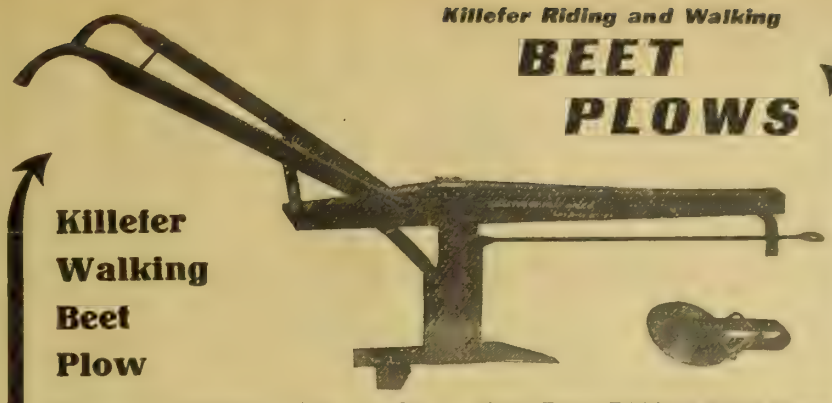
GROWING CUCUMBERS UNDER GLASS.

There is something attractive in producing cucumbers and other small products under glass so as to market out of season at long prices. The prices obtained during January and February are such that it looks as if great expense could be incurred in the production and still make a large amount of money, but we are told that one glass house in Los Angeles County, contracted for at a cost of $2,500, has been unable to make much profit because of the extremely limited time in which to market. California's climate is so favorable to all-the-year production that even cucumbers with cheap hot beds to aid will grow in the open most of the year, so that the glass house method will not pay cost of house construction. In the East, where there is a period of months when it is impossible to grow outdoors cucumbers and tomatoes and other such delicacies, the glass house proves more profitable.

The tomato is subject to attacks of various insect pests and diseases, among which are the tomato worm, which can be controlled by the use of sprays of Paris green and arsenate of lead or by hand picking; cutworms, which may be controlled to some extent by plowing the soil two weeks before transplanting and by the use of poisoned baits; the stalk borer, which may be controlled to some extent by the preventive measures of keeping the field free from weeds and foreign plants and practicing a rotation of crops; point rot, for which there is at present no effective means of control; ripe rot or anthracnose, the injury from which may be reduced by destroying diseased fruits and planting far enough apart to admit light and air into the plants; and leaf-spot diseases, the standard remedy for which is spraying with Bordeaux mixture.

Killefer Riding and Walking

BEET PLOWS



Killefer Walking Beet Plow

This is the strongest plow on the market. Can be had with straight or offset standard, and has one piece land side. Nothing but hard plow steel is used in the Standard Shin Landside and point. Point and Shin are reversible. We guarantee this plow to do satisfactory work in any beet section.

Two Row Riding Beet Plow

It is especially adapted to large acreage, as it does double the work of single plows with but little more draft, and leaves the ground in fine condition for hauling off beets, as it does not throw up large clods.

The Standard Shin Landside Point and wings are made of very hard steel, which we have rolled for this work, and extras are always on hand for immediate shipment.

Both plows can be had with or without steering device. Write or call on us direct if your dealer does not have these tools.

Killefer Mfg. Co.

2210 Santa Fe Avenue
Los Angeles, Cal.

Tell us your troubles. We make special tools to order for handling special work.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

CONTENTS THIS WEEK

TWO WEALTH PRODUCERS OF IMPERIAL VALLEY. Cover.

CANTALOUPE GROWING IN BRAWLEY, 3.

SEPTIC TANK CONSTRUCTION, 3.

CITRUS AND TROPICAL FRUITS.—The Australian Orange Tree; Fertilizer Removed by Orange Crop; 4, 5.

DECIDUOUS FRUIT CULTURE.—Diseases of Economic Plants; Gathering Cots; Making Cider; 6, 7.

LIVE STOCK AND DAIRY.— The Registered Bull; Succulence and Silos; Imperial Packing House; 8, 9.

VETERINARY.—Worm Powder; Udder Caked; Scratches; 9.

ORNAMENTAL GARDEN.—This Month; New Roses from Seed; Success in Growing Plants; 10.

SMALL FRUITS AND VEGETABLES.—This month; Okra Cucumbers Under Glass; 11.

EDITORIAL.—Pedigree; Apple Annual; Fire Evil; Bananas; Wheat Production; Editorial Notes; 12.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST. — Northern, Central, Southern, The Coast; 13.

PROFIT IN THE POULTRY YARD.—Summer Work; 14, 15.

LEGAL. — Inheritance of Homestead Right; Taxing Desert Claims; Horse Left in Pasture; 18.

QUESTIONS AND ANSWERS.—The Moult; Leghorns; Marking Fowls; Drakes or Ducks; Eyes Shut; Aphis; To Pick Ducks; Blight on Tomatoes; 17, 18.

HOUSEHOLD DEPARTMENT. — Good Morning; How Balaam Abetted; 20, 21.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 22, 23.

Recent investigations as to Porto Rico's agricultural conditions, as reported by the Department of Agriculture, show that during 1910 the exports and imports of the islands increased to $68,595,074, while in 1901 the total amounted to only $17,502,103. Living conditions on the islands have also greatly improved.

PEDIGREE.

The word "pedigree" should not be debased or carelessly used as we fear it may be, especially when applied to "pedigreed plants," where an actual pedigree has not been established. A pedigreed plant, like a pedigreed animal, should be one that has been "recorded, known, of notable descent." This matter of pedigree was discussed at the last Pacific Coast Nurserymens Convention at San Jose.

We note a circular issued by a firm of nurserymen which appeals for "better stock, better labelling, better fruit," and in referring to the matter of better stock and fruit the word "pedigree" is freely used. This is most laudable and it is possible this particular concern has stock which is actually pedigreed and that the "buds and scions packed and labelled by this concern are sent out under a seal." If for "generations" the stock has been followed and its known performance records kept, the claims of the firm may be justified, but we do know that there has been carelessness in the use of the term. We may also mention the fact that when Mr. Shamel, the government expert, took up the matter of producing a finer strain of Washington Navels, he prepared his first blanks with the heading, "Orange Pedigree Record." Realizing the true meaning of the word "pedigree," he crossed it out and substituted "Orange Performance Record." In the course of years we doubt not Mr. Shamel will be able to place tags upon certain trees showing that they are entitled to head a line of pedigreed stock. We trust the term will not be brought into discredit through thoughtless use. When we say we are furnishing pedigreed stock, let us be able to trace back and give actual pedigree. If it is selected stock and the nurseryman has shown extra care, let the fact be stated, but not under the false claim of pedigree.

APPLE ANNUAL.

The management of the Watsonville Apple Annual is busy these days preparing for the next great show which will occur October 9-14. President Stoesser recently informed us that plans are in the making for a bigger and better show than last year, and that was so successful that it astonished the whole Pacific Coast. Sixteen exhibits were made at that time with a full carload in each exhibit. Hundreds and even thousands of other exhibits were made of lesser quantities of fruit. The pavilion built for the show was not only filled, but two immense tents outside were also used. The only disappointing feature was the heavy rain which prevailed during the first three days. Three judges were compelled to place ribbons on the immense amount of fruit last year, but for this year five have already been selected. All are from outside the boundaries of California. The presiding judge will be, as last year, Mr. C. E. Rowe of Grand Rapids, Michigan. The others are: J. L. Dumas, Walla Walla, Washington; C. J. Sinsel, Boise, Idaho; A. P. Bateham, Mosher, Oregon; F. H. Stanton, Hood River, Oregon.

THE FIRE EVIL.

The Western Forestry and Conservation Association with headquarters at Portland, has issued 350,000 leaflets on the forest fire evil. These are being distributed to school children in the four states of the Northwest.

Here are a few of the rules for preventing fires, which are equally as applicable in California:

"Don't toss away burning matches or tobacco.

"Don't make a campfire in leaves, rotten wood, or against logs, where it may spread or where you cannot be sure it is out.

"Never leave a fire until it is out.

"Don't burn a slashing in the dry season without a permit and without taking care to keep the fire from getting away.

"Put out any fire you find if you can. If you can't notify a fire warden, some other public officer, or the land owner."

BANANAS.

The United States imported last year over 40,000,000 bunches of bananas which some genius has figured out as aggregating 3,000,000,000 of the fruits. This necessitates each man, woman and child of us eating three dozen every year. Another genius, or perhaps the same one, has figured out that the "slip" of these peels would be sufficient to launch all the ships of the world. The wholesale value of this fruit at the point of export was over $12,500,000. Doubtless the consuming public feels it pays in excess of three times that. The importation has more than doubled in the last ten years and it is said the acreage being planted in the tropics is almost startling. The United States is by long odds the greatest consumer of this luscious fruit.

The wheat production in the United States in 1870 was 236 million bushels; in 1880, 498½ million; in 1889, 490½ million (dropping to 399 million in 1890, but advancing to 612 million in 1891, 522 million in 1900, and 665 million in 1910; though even higher records were made in 1901, 748 million bushels, and 1906, 735 million. The quantity of wheat retained for domestic consumption has greatly increased, while the quantity exported has been reduced. In the fiscal year 1910 the quantity retained for consumption was 650 million bushels, being larger than in any earlier year; and the quantity exported, 87 million, which was less than in any fiscal year since 1877, with the single exception of 1905, when only 44 million bushels were exported. In 1908 the exports aggregated 163 million bushels, and in 1902, the high record year in wheat exportations, 235 million.

The world's total silk output during 1910 was 24,350,000 kilos, a kilo being 2.2046 pounds. This was a slight decrease as compared with the year 1909. The total world's production in 1876 was only 8,354,000 kilos. Since that time the increase has been steady to the present immense quantity. The United States does not seem to be a material factor in the production. Approximately one-fifth of the world's output comes from western Europe, while the Orient produces far more than half. 5,345,000 kilos come from the port of Shanghai.

Growers of spuds have an opportunity to contest for a $1,000 silver cup to be offered by the great land show management at its exposition to be held next November. Productivity, edibility and appearance will be the principal requirements.

Humboldt County creameries paid for butterfat during the month of May the following prices: Libby, McNeil & Libby, 28c per pound; Central Creamery, 26¼c; Pioneer, 26c; Grizly Bluff Creamery, 25½c; Capitol Creamery, 25½c. The San Francisco butter price averaged 22½c for the month.

The man who predicts the downfall of the automobile is not a good prophet. The man who denies its great necessity and general adaptation to the needs of modern civilization is still less a prophet, while the man who predicts the annihilation of the horse because of the automobile, is foolish. While it is possible that there is a falling off in demand and prices of certain classes of light horses, like drivers and delivery horses on account of the increased use of the automobile and auto truck, there has been a steady increase in demand for the heavy draft type of horses, and this to such an extent that there are now indications of a reduction in the output of motors and cars during the coming season. This is the age of the draft horse, and in no place does he thrive better, develop to greater perfection and become more useful and valuable than in Kansas.—Kansas Farmer.

While at the Experiment Grounds at Spreckels Sugar Factory we saw a small plot of recently introduced barley which was spoken of by Prof. Shaw as one of the best for Californians. It is known as the Beldi. Prof. Shaw states that a planting of 320 acres of this barley has been made by Mr. A. M. Paul, manager of the Hendricks Estate near Riverside. This barley has been known to run in this state as high as 86 bushels (about 40 sacks) per acre. It is ten days earlier in ripening than the ordinary variety, and is thought to be particularly desirable for the hot interior valleys. Prof. Shaw suggests that in the Imperial Valley it will make a good crop to be followed by cotton.

One of the officers of the California Fruit Growers Exchange who can show a long term of service is Mr. Earl F. Van Luven of the Colton Exchange of which he was made manager at the formation of the organization back in the early nineties when the total shipments of his exchange amounted to only 61 cars. Shipments of that organization last year were in excess of 1500 cars. Mr. Van Luven now finds that his own interests compel his entire attention and he has resigned. He will be succeeded by Mr. B. B. Shepherd who has been Mr. Van Luven's assistant for five years.

The educational system of Young Mens Christian Associations throughout the country is attracting more and more attention every year. One of the new departures is the giving of attention to agricultural training. Poultry has come in for an especially attractive course in several different cities which are surrounded by agricultural communities.

The average value of farm lands in New Mexico has increased 160 per cent during the last decade, the number of farms 180 per cent, and improved land in farms 348 per cent. The total value of farm lands has increased 469 per cent.

The Percheron Society of America is having the most rapid expansion in membership in its history. The gain in new members between November 28, 1910 and June 20, 1911 was 784. This sum was an average gain of more than 112 monthly. Every state in the Union is now represented in the membership of the organization. "Facts About Percherons" will be mailed to those interested in the draft horse by Wayne Dinsmore, Secretary, Union Stock Yards, Chicago.

Agricultural News Notes of the Pacific Coast

Northern California

A Shetland pony farm is to be located near Williams, Colusa County.

The cannery at Marysville, Yuba County, will begin operations July 8.

The asparagus cannery at Walnut Grove, Sacramento County, has closed.

Glenn County has a pumping plant which is lifting 900 cubic feet of water per second.

Fresh fruit packing houses at Winters, Yolo County, are running to fullest capacity.

A large flow of artesian water has been struck near Germantown, in Glenn County.

Another dairy farm of over 300 acres is being established near Yuba City, Sutter County.

Vacaville fruit growers are being given a special daily fruit service by the Southern Pacific.

A sale of 82,000 pounds of hops was made by growers at Sonoma County at 25 cents a pound.

The new alfalfa meal mill at Chico, having a capacity of sixty tons a day, has just begun operations.

Santa Rosa grange has placed itself on record as favoring the establishment of free county libraries.

Several new instructors have been added to the faculty of the State Farm School at Davis, Yolo County.

The grain acreage of Woodland, Yolo County, although less than last year, promises a much heavier yield.

The directors of the Oakdale irrigation district are planning for the bringing of 70,000 acres of land under water.

Deputy Horticultural Commissioner Anderson of Yolo County is making an onslaught on Johnson grass along irrigation ditches.

The largest first shipment of pears ever sent from California left Vacaville last week. They were of the Wilder variety.

The Country Life Commission of California is planning to hold its next annual session at Davis during Farmers Week in October.

Contra Costa County apricot growers are contracting their cots at $55 per ton. Last year at this time the prices were ranging about $20.

The new alfalfa meal mill at Gerber, Tehama County, has started in on the second crop of alfalfa. It has an output of 80 tons a day and employs 30 men.

Fruit men of Oroville, Butte County, estimate a record breaking crop of Navel oranges. Reports from Wyandotte and Palermo are also most favorable.

Hop growers of Wheatland, Yuba County, expect the largest yield in their history. The local yards will employ about 2500 people to harvest the coming crop.

A sheep rancher living near Colusa has lost a number of valuable sheep killed by dogs. Many of the sheep were drowned in the Sacramento in trying to escape.

The premium list for the second annual Gravenstein Apple Fair at Sebastopol has been announced, and is far larger than last year. There are several large money prizes.

Central California

Apricot dryers are in the midst of a big cutting and drying campaign.

Three hundred acres of hemp were planted this year near Lodi, San Joaquin County.

The management of the Kings County Fair Association has decided to hold a fair this year.

Some citizens of Fresno are agitating a national irrigation exposition for Fresno in 1915.

A huge raisin stemmer has been installed at one of the raisin packing houses of Hanford, Kings County.

A 520-acre orange orchard is to be planted at Porterville, Tulare County. It will be the property of one man.

Thousands of acres are being planted to beans near Stockton on lands from which the water is being pumped.

New crop raisin contracts are being made on a $90 basis. Most growers, however, are holding for straight five cents a pound.

Some are estimating as high as 50,000 tons of raisins in the San Joaquin Valley, while others feel that this is altogether too high.

Some fruit growers near Porterville, Tulare County, maintain that certain characteristics of trees may be regulated by bud selection.

The Pajaro Valley poultry association has been conducting a hundred-new-members campaign. One week's work shows a gain of forty names.

An estimate of the prune crop of Kings County is that it will be not far from 30 per cent of normal. The growers are holding on a five-cent basis.

A. E. Miot, Secretary of the Tulare County Board of Trade, has delivered lectures in Los Angeles at which the total attendance aggregated almost 13,000.

A reclamation and levee district 35 miles long along the banks of the Tule River and reaching from the foothills nearly to Tulare Lake is under contemplation.

The district about Sanger and Selma, Fresno County, is one of the first in the state to put up a thorough anti-squirrel campaign. It is now showing decided results.

The Zante Citrus Association recently elected the following officers: V. D. Knupp, President; W. L. Hemphill, Vice-President; G. H. Langford, Secretary and Manager.

The great irrigation district contemplated for lands along the west side of the San Joaquin Valley and which at first was to include about a million acres now calls for a reduction of acreage to 370,000.

The first full car of fresh fruit shipped from Exeter, Tulare County, this season, consisted of Tragedy prunes, Burbank and Clyman plums. It sold in Chicago for $2254. The Tragedys commanded the highest prices, commanding $3.10 per box.

At a well attended meeting of Kings County stock and dairy men held at Hanford recently after an address by State Veterinarian Keane, it was declared the sense of the meeting that drastic measures looking toward the eradication of tuberculosis of dairy cattle should be taken.

Southern California

Orange County is agitating a campaign against the pestiferous coyote.

Orange County apricot growers are contracting dried fruit for 13½ and 14c.

Oxnard, Ventura County, expects to have a eucalyptus mill in operation by fall.

Hundreds of cattle are being brought into the Imperial Valley from Arizona ranges.

The apricot pit, once considered valueless, is now bringing the growers $30 a ton.

It is said that the Riverside district is not shipping as many oranges today as it did ten years ago.

A potato grower at Monrovia has realized a profit of $210 an acre for this season's production.

Sixty-five cars of oranges daily are being run through the pre-cooling plant at San Bernardino.

A tract of acreage at Winchester, Riverside County, will be subdivided and sold in ten and twenty-acre tracts.

A Redlands shipper will forward a car of ripe olive pickles for distribution in various New England sections.

A great irrigation project is planned for San Diego County. The principal factor will be a dam near Escondido.

The outlook for the walnut crop in Orange County is very promising. Harvesting does not begin until October.

The Anaheim Fruit Association recently secured for its members 15 tons of vetch seed for green manure crops.

A carload of sugar beets taken from Calexico to the factory at Glendale, Arizona, showed a test of 22 per cent sugar.

The county bee inspector of San Bernardino says that some bee men are being buncoed by so-called land agents.

The apricot season at Banning, San Bernardino County, opened later than usual, but the dry yards are running full handed now.

Huntington Beach is making complaint because of careless destruction of fine fruit trees by roaming stock and horses that are tied to them.

Prices of honey are running high owing to small crop. It is estimated that Southern California's output will be about half of the normal production.

Prof. Woodworth recently addressed the citrus growers of Covina on the subject of gas leakage in fumigation and methods of measuring content of tents.

Horticultural Commissioner Cundiff of Riverside County is experimenting with colonies of the beneficial parasite, scymins vagans, which it is hoped will control the red spider.

A cantaloupe train believed to be the longest the world has ever seen, left Imperial Valley for Chicago recently. It consisted of 130 cars and was a mile and a half in length.

The Chucawalla Development Company is pushing its plans for placing water on the Palo Verde mesa and some enthusiastic ones predict a valuation of $150 per acre on the mesa and in Chucawalla Valley.

The Coast

Stockmen at Boise, Idaho, are having excellent results with blue grass pasture.

At the recent horse sale at La Crosse, Washington, average price per head was $160.

Farmers of Springdale, Washington, say the hay crop this year will be the heaviest ever known.

Kittitas farmers will hold their first swapping bee June 21st to get rid of surplus stock and farm machinery.

Summer rains are falling at Tucson, Benson and Phoenix, Arizona. It is said to be rather earlier than usual.

The state veterinarian of Oregon is adopting drastic measures to stop the ravages of hog cholera near Portland.

The Lewiston section in Idaho estimates a yield of 10,000,000 bushels of wheat, an increase of 10 per cent over last year.

A creamery war is on at Kennewick, Washington. Rival companies are selling cows to farmers on the installment plan.

Arizona is already having fierce brush fires, one train being held up last week by a fire on the Yuma Indian Reservation.

The rebellion in Mexico is subsiding sufficiently so that farming and other operations are gradually returning to normal conditions.

Grain growers of Boise, Idaho, are petitioning the state game warden for an open season on quail because of great damage to grain.

The Winnipeg Free Press reports big attendance at the annual plowing match held by the Birds Hill and Springfield Farmers Institute.

Dr. Pinkerton, Northwest Chief of the Bureau of Animal Industry, has been called to Bannock County, Idaho, by a serious outbreak of sheep scab.

A plantation of tobacco is to be made at Kennewick, Washington. It is claimed the Columbia River Valley will produce some of the finest tobacco grown.

Report from Pullman, Washington, states that the cherry harvest of the Snake River is half over. Growers have been getting in the neighborhood of 85 cents a box.

Wool men of Baker, Oregon, have sold most of their clip at private sale this season. The last wool sale scheduled at Baker failed to materialize because of small quantity on hand.

Officials of the Tahoe National Forest have erected a watch tower on Banner Mountain which gives a view for many miles surrounding. It is for the purpose of quickly locating forest fires.

Caterpillars are overrunning everything so at Vancouver, Washington, that they are underfoot everywhere, and request has been made for the fire department to permit the use of fire engines for throwing poison solutions over all vegetation.

A fruit grower at Canyon City, Colorado, has found good results in exterminating the leaf roller pest through the use of smudge pots such as are used in frost protection. He places the pots in shallow pans of water, over the water being a light covering of paraffine oil, and he finds the leaf roller moths in the oil in the morning.

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

Pacific Egg Food

Makes hens lay; none better.
Good for molting time, too.

Special prices: 90 lb. sack, $1.75; 75 lb. sack, $1.50; ton, $37.50

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

SUMMER WORK.

By Mrs. A. Basley.

"Seed time and harvest, summer and winter," have not ceased and each season brings its own work. We will consider part of the summer work in our poultry yards.

The good little hens, those that have worked so faithfully for us during the winter and spring deserve some extra care and even those who seem to have failed in their duty of laying eggs, they too should receive the extra care that will either make them more profitable to us in the future or render them fit subjects for the table.

Summer time should be a restful time and yet a growing time for the young. I always take the summer to rest from incubator work, and I like a change of work, so turning my attention to the fruits, vegetables and flowers, I let those hens that want to sit have the pleasure and comfort of hatching, I like to reward a good hen in this way, I really think it greatly helps them through the moult. It is a rest to a hen to retire from the society of her sister hens and to isolate herself with her precious eggs. Some hens, especially the Orpingtons, Cornish fowls, and White Rocks are particularly fond of their eggs, more so than the other breeds. They love to take care of them, turning them every minute of the day. Some are such attentive mothers that they sit too closely, being even unwilling to leave the eggs long enough to eat sufficient to keep up their own strength, nor long enough to air and cool the eggs, which is necessary to bring hardy chicks.

Turkey hens are very close sitters, They will sometimes starve to death, if not watched and removed daily. Muscovy ducks also are exceedingly faithful sitters and as their own eggs require thirty-six days to hatch, they really make good incubators for hen, or turkey eggs. They are used in France as incubators.

Summer work is not all "setting hens." It is although a light and easy work, a most necessary one. As in our ideal climate we have almost perfect summer weather the whole year round, summer work is almost a misnomer, perhaps I ought to call it "growing time" for the youngsters; "resting time" for the incubators; "war time" for the mites and lice, and "planning time" for poultry raisers. Now is the time to plan for eggs in the coming winter, for prizes at the shows, and for future prosperity.

Summer time is a good time for commencing in the poultry business. The weather is sure to be fine, and one can build and lay out yards and houses to better advantage than at other times. Part of our summer work should certainly be devoted to planning, but just today let us interest ourselves in the growing of the youngsters.

"Be sure to keep the pullets growing" was the order given in one of the poultry books that many years ago I was studying. The writer did not say how to keep them growing, nor what would prevent chicks growing, and I fairly hated that man for being so indefinite. Since then I decided that, poor fellow, he probably did not know himself. We will consider a few of the things that prevent growth at this season and the methods of encouraging growth and development of the young stock in the early summer.

There are three essentials for promoting growth. The proper food and water being the first requisites; secondary to these but almost as important, comes comfort, and last but not least, is exercise. I may say that the ideal way of promoting growth is to have the youngsters on a free grass range, with plenty of shade trees and plenty of sunshine. The range must have green succulent grass or clover and alfalfa with an abundance of bugs, grubs, worms, insects. This would be nature's own way of providing food, exercise, comfort. If in addition the chicks can be provided with a safe roosting place, sheltered on three sides from wind and overhead by the roof from dew or rain, protected from night prowlers by a chicken wire front, these would be ideal conditions for growth, for building up strong and vigorous bodies, for success and wealth to the owner.

Can you give your chickens such free range? Of what does your range consist? The needs of fowls do not vary, but the resources of places do. Does your free range at the present season include green grass or green alfalfa? Or is it a dry hillside with only cactus, horehound or sagebrush? Is it a dry stubble field or weeds? If any of these, you will have to supply deficiency by growing plenty of succulent green of some kind. The lack of bugs, worms, etc., we must supply, for these all vanish from the dried up summer condition of most free ranges, the worms go down so deep that no hen could scratch them up.

What would be a good substitute? The best I know is homemade cottage cheese and a pan of skim (or separated) milk, either sweet or clabber. Next to that either granulated or dried milk which can be bought at poultry houses; cooked or raw ground meat; or good beef scraps. The beef scraps must be good. It is quite difficult to keep beef scraps or beef meal in this climate, some that may be good when first purchased, if kept in a damp place or a warm place becomes lumpy, and these lumps frequently are found to contain a fungoid growth which is very poisonous. I have known of the deaths of thousands of chicks from this cause, so besides being careful to buy good beef scraps free from stones, dirt, hair, hoofs and horn, be careful where and how you keep it. Ground green bone or bone that is properly ground before grinding tend to promote growth and are good substitute for insects.

On the free range there should be kept a hopper or box of grain. I prefer the wheat and kafir corn mixed. These do not spoil or ferment as quickly as grains that are broken or crushed.

Culling is part of the summer work which might almost come under the head of economy. The cockerels should be culled, that is separated from the pullets. This should be done

as early as it is possible to detect the difference in the sexes by the comb and wattles. My reasons for this are that the more room and the more freedom the pullets have the better they will develop, while if the growing young cockerels are kept together by themselves they will not scrap or fight and can be fed more easily for the market.

The sexes are about even in a hatch. The pullets we want for egg production and the cockerels to be fattened for market, only keeping out the few necessary for breeding purposes.

Summer work with the little chicks means keeping them clean from lice and mites and fleas, not allowing them to run with the older fowls and keeping their houses and runs clean, growing them plenty of green food. I do not think it is possible to overfeed them with alfalfa, lettuce, clover or cabbage. Of course green clover or alfalfa cannot be left in a heap as one man did. In a short time his fowls were sick, when he gave them food they would not eat, looked at it, backed away, tumbled over, acted either silly or sleepy, walked when roused like they were drunk. He thought the fowls must be inbred or have weak constitutions. Just careless summer work about ruined that flock and that man gave up the poultry business, declaring it a fraud.

Green clover, alfalfa or any vegetable will not give (but will prevent) diarrhoea. Diarrhoea is caused by meat, animal food, anything putrid or mouldy, mouldy bread and even mouldy vegetables. Never throw vegetables, parings or leaves on the ground in the chicken yard, you will soon have a vile-smelling, unhealthy place and diseases of all kinds. Dig a hole and bury all that you cannot chop up. Chop up raw vegetables, because chickens have no teeth and cannot bite off the food. If it is growing or fastened, they may peck or pull off a mouthful at a time, but when thrown out they cannot bite it off, but will drag it around and get it so dirty that it would be poisonous for them to eat it.

Cleanliness, green food, clean water, shade, that is a synopsis of summer work. That will keep the little chicks free from all ailments and will keep the pullets growing.

If you do not wish to sell off the cockerels and have range to keep them, about three weeks before you want to market them, put them up to fatten them, or I might say to fleshen up for market, for we want to put juicy flesh upon them, and not layers of fat. In order to make them tender and juicy we must restrict their liberty, by keeping them in a very small yard, or in a fattening coop. This will prevent their forming muscle and make the flesh tender, while the proper food will tend to make them juicy.

The crate used for fattening fowls can be four or six feet long. Mine were composed of lath six feet long; the frame of the crate is 6 feet long, 18 inches wide and 18 inches high, divided into six little stalls or compartments. The frame is covered with lath, placed lengthwise on the bottom, back and top the width of one lath apart. The first lath on the bottom should be two inches from the back to allow the droppings to fall through, otherwise they would lodge on the lath at the back. The lath are placed up and down in the front, the spaces between them being two inches wide to enable the chickens to feed from the trough. A V-shaped trough is made to fit into two notches in cleats in front of each crate. The crate stands 15 inches from the ground; the droppings are received on sand or other absorbent material and removed daily. The coop is large enough to hold 12 or 18 young chicks (2 or 3 in a stall) or six full grown fowls. Fowls are fed three times a day all they will eat in 15 minutes.

A good formula for fattening is equal parts of bran, corn meal and oat meal mixed with skimmed milk, fed three times a day. The last week of the fattening process, five per cent of cotton seed meal may be added. A little salt and coarse sand or grit should be added to the food. Chickens do not seem to be able to stand the confinement and crate feeding for more than three weeks. The food should be removed in fifteen or twenty minutes and fresh water left before them. This feeding will make them juicy, tender and delicious. Old fowls will be made wonderfully tender by a three weeks course of this feeding.

When the mother hens wean their chickens, see that all the lonesome little fellows do not crowd into one coop. Where crowding occurs, some of the weaker chicks are often smothered to death.

POULTRY SUPPLIES

In Ordering any of these Supplies Please Consult Page 743 of the Cultivator, Published June 22, and You will see attractive prices on Groceries, which You want to Include in Your order.

	Per sack
Lightning Chick Grower, 5-lb. sack	$0.50
Stayco Chick Feed, 100-lb. sack	2.60
Egg Food, 90-lb. sack	2.10
Scratch Feed, 100-lb. sack	2.00
Alfalfa Meal, 100 lbs.	1.25
B. B. Meal (blood-bone)	2.40
Beef Scraps (best made), 100 lbs.	3.10
Bone, Ground, Local, 100 lbs.	2.10
Bone Meal, Local, 100 lbs.	2.20

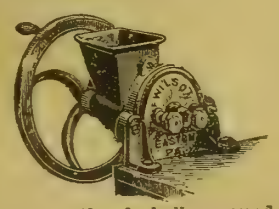
Oats, White	1.90
Oats, Red	1.80

GRINDING MILL.



For hand use; will grind dry bones, shells, all kinds of grain, rock, crockery, stale bread, crackers, spices, etc. A customer writes us that he sold $105 worth of shells ground on a No. 1 Mill, and the mill is as good as new. We also furnish sleeve attachment to this mill for separating the dust when crushing shells, and flour when cracking grain; price 60c extra. Diameter of hand wheel is 20 inches.

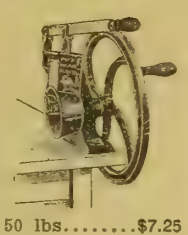
Without stand, weight 36 lbs. $5.25
With stand, weight 64 lbs. 6.50

BONE AND SHELL MILL

No. 750 for use on bench or box. Intended for grinding dry bones, shells, corn, roots, bark, feed, etc. Strong and cuts rapidly. Capacity 70 lbs. per hour.

Wght 60 lbs. .. $9.00

GREEN BONE CUTTER



Best for the money. Cuts easily, fine and fast. Has steel knives which can be taken out and sharpened and reset in a few minutes. Diameter of hand wheel 22 inches.

Without stand, weight 50 lbs. $7.25
With stand, weight 80 lbs. 9.00

ALFALFA CUTTER

This machine will cut hay, grass, clover, cabbage leaves, or any kind of green feed for fowls. Size 16 inches long by 11 inches wide. It will cut enough feed in one minute for three dozen fowls, and by means of the adjustable gauge can be regulated to cut from ¼ inch to any desired length.

Weight 7 lbs. $3.25

LITTLE ASPINWALL SPRAYER

These sprayers are needed by every poultryman and farmer; just the thing for spraying Lice Killer. They are used extensively on horses, cattle, swine, and for spraying clothes, carpets, cigar wrappers, etc., in fact, wherever a sprayer is needed.

Each 50c

LIGHTNING INSECT SPRAYER.

Made of tin. Suitable for spraying any of the thin liquid lice exterminators commonly used in poultry houses.

Each 50c

The Complete Sprayer. Is adapted to spray any of the liquids commonly used for poultry houses, orchards and gardens. For whitewashing this pump has no superior, and we highly recommend the "Complete" for whitewashing fences, and poultry houses and large buildings. The tank is galvanized iron, holds five gallons of liquid, which is forced through the nozzle with compressed air, pumped into the tank by the use of a brass force-pump.

Weight, 10 pounds $4.65

LIGHTNING WHITEWASH SPRAYER NO. 28

The best low priced bucket spray pump made, of heavy galvanized iron, and especially suitable for spraying whitewash in poultry houses and on fences.

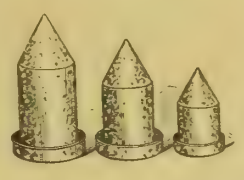
Price, each $1.75

POWDER GUNS

About as large as can be comfortably held in the hand.

Price, each 23c

DRINKING FOUNTAINS



These fountains are made of heavy galvanized iron and will not rust or break, and with reasonable care will last a lifetime. Can be taken apart and easily cleaned. Fowls cannot get on top or into them, nor turn them over. These fountains give the best satisfaction.

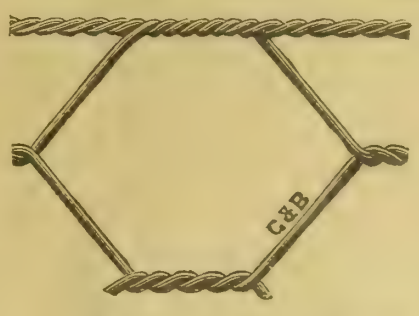
No. 1—One quart 23c
No. 2—Two quarts 36c
No. 3—Six quarts 53c

POULTRY NETTING

Sold in rolls of 150 lineal feet only.

Carried in stock all widths, 12 to 72 inches. In ordering specify width, size of mesh, and guage of wire. We quote only No. 20 guage wire, which is the common standard used.

2-Inch Mesh—	Per roll
12 inches wide, 150 feet long	$ .65
24 inches wide, 150 feet long	1.30
36 inches wide, 150 feet long	1.95
48 inches wide, 150 feet long	2.60
60 inches wide, 150 feet long	3.25
72 inches wide, 150 feet long	3.75
1½-Inch Mesh—	
12 inches wide, 150 feet long	.90
24 inches wide, 150 feet long	1.81
36 inches wide, 150 feet long	2.70
48 inches wide, 150 feet long	3.61
60 inches wide, 150 feet long	4.51
72 inches wide, 150 feet long	5.42



1-Inch Mesh—	
12 inches wide, 150 feet long	1.69
24 inches wide, 150 feet long	3.33
36 inches wide, 150 feet long	4.97
48 inches wide, 150 feet long	6.61
60 inches wide, 150 feet long	8.27
72 inches wide, 150 feet long	9.90

Above wire is galvanized before weaving.

POULTRY AND RABBIT FENCE

Style No. 28

Showing special graduated diamond mesh Poultry and Rabbit Fence. Height 25½ to 60 inches. Rolls 10 and 20 rods each. Top and bottom wires No. 11 guage, intermediate line wires No. 14, mesh wires No. 16—2½ inch mesh. All wires of self-regulating coiled spring.

This fence will stop poultry on one side, and hogs, sheep and cattle on the other, owing to the fact that it is constructed of all large wires, woven closely together. It is not necessary to use top or bottom rail with this fence.

This fencing is shipped direct to you from the factory at Stockton, Cal.

		Weight per rod.	Price per rod.
Height	60 inches	13.2 lbs.	$0.72
Height	54 inches	12.6 lbs.	.69
Height	48 inches	11.0 lbs.	.66
Height	36 inches	8.7 lbs.	.51
Height	30 inches	7.7 lbs.	.45
Height	25½ inches	6.6 lbs.	.40

All of the Poultry and Stock Foods we quote are balanced rations of the best grade, properly blended and compounded to get the results looked for in the shortest time possible. Remember they are sold with our absolute guarantee of satisfaction or money refunded.

CANTALOUPES AT BRAWLEY.

Continued from Page 3.

labeled and stacked ready for the seasons' shipments. The packing is done in the fields and the melons delivered at the shed ready for loading on the cars, which are run directly into the shed to keep from the direct rays of the sun. The loading is accomplished by arranging the crates in tiers and "stripping," much the same as oranges, apples and other fruits are stripped or nailed in the car. The cars vary somewhat in the number of crates but it is scarcely ever below 306 and sometimes as high as 380.

It may be interesting to know what is meant by a crate. There are three different sizes. The pony is 11x11x23½ and contains 54 of the smallest size cantaloupes. The next size is the standard and preferred size, which is 12x12x23½. This contains 45 desirable fruits of about four inches in diameter. The jumbo or largest crate is 13x13x23½, and though larger contains a less number of fruits, viz., 36, still larger than the standards. The cost of these crates is about 13c each, or including the making about 16c. This one house will send out in the middle of this season about 18 cars daily.

Cantaloupes have proven remarkably profitable some seasons. The first two in particular the profits were very great. This caused a rush of planters and the season following was nothing more or less than a calamity. Dozens of men who had rushed there with a small amount of capital and no experience, expecting to carry the fruit through at a great profit, left without a penny, and many laborers who had been enticed to the Valley by offer of good wages through the season, were unable to collect for their work enough to pay for their railroad fare. Last year, however, the business returned to a sane or normal condition, and this year there is every promise of profit to those who are engaged in it. It is a business which requires intelligent farming. This year there are perhaps 700 acres planted in the Valley which will not be marketed, this for the reason that the planters did not give intelligent early care and the fields are so spotted as to be a practical failure. The man who goes into this business without fully understanding the requirements is indeed foolish.

We may note one departure which may lead to greater profit. It is the combination of melons and cotton. One of the Japanese growers tried it last year, and several are making the experiment this. The melons will be out of the way by the middle of July when the cotton will require greater attention and moisture. Then the vines may be removed and the entire season given to the growth of the cotton. It looks well in theory. The output last year was about 1800 cars. It is thought that it will exceed 2000 this year.

One difficulty with the industry has been the marketing. Co-operation seems to have been almost a failure. The one association of which Mr. Hovley is president, has held together and done well, but the majority of the growers have not yet seen the value of getting together upon a purely co-operative marketing basis. Some of the growers are whites and some Japanese, all of various grades of intelligence; many are suspicious and will not trust their business in the hands of anyone else, and so long as this spirit obtains co-operation cannot be brought about.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

The Moult.

Should hens moult in June? If not, what would cause them to do so? I have some fine Barred Rocks that are moulting now.—Mrs. H. C. W., Goshen.

We consider that the moult should come on in August. However, it is not possible to fix any sure date, for young hens (especially in their first moult) moult earlier than the older hens. Also when a hen has been sitting she almost always moults if it is near the moulting season, and I think that the quiet, warm days with a smaller amount of food which a setting hen eats helps to loosen the feathers, so that a hen that is mothering chicks comes through the moult earlier, quicker and better than one that is not so occupied. Give your moulting hens plenty of green food at this time of the year.—A. B.

Leghorns.

What are the Standard requirements of Single Comb White Leghorns, especially the color of the legs? —A. R., Tulare.

For a full description of the S. C. W. Leghorns see the new Standard of Perfection. The shanks and toes should be rich yellow. However, red showing on the outside back of the scales in cockerels is not a defect, but shows vigor. The disqualifications are red covering more than one-half of the surface of the earlobes in cockerels and pullets; feathers other than white in any part of plumage; shanks other than yellow. I would add that if the land in the poultry yard is the dark adobe, or alkali, you will have difficulty in keeping the legs a good yellow. The real yellow comes when they are on green grass.—A. B.

Marking Fowls.

What is the best way to mark fowls so one can tell their age at any time? Do you consider punching the feet satisfactory? If so, at what age should the feet of young chicks be punched? —Subscriber, Tulare.

The best way of marking fowls is by toe punching. This should be done as soon as they are put in the brooder, or about the first day after they are hatched; the sooner the better, as the toes do not then bleed and it does not seem to hurt the chick. You can punch or mark one foot this year and the other foot next year. There are sixteen ways given for marking with every toe punch.—A. B.

Drakes or Ducks..

Kindly state in your next issue how to tell the drakes of a flock of Fawn Indian Runners at nine weeks old, as I wish to keep the ducks for laying.—A. D. D., Artesia.

When the ducklings are only a day or two old the little males are usually larger than the females. At nine weeks of age there is not much difference in their size, but the male has a squeaky, light voice, more of a whistle than a quack, as if he had a sore throat, whilest the female not only does most of the talking, but her voice is deeper and the quack very distinct and loud. At twelve or fourteen weeks the drakes get curled feathers in the tail.—A. B.

Eyes Shut.

What causes the eyes of young chicks to stick shut? They do not usually commence until the fourth day, and last two or three days. They do not seem to be sick, as they go right to eating when the eyes are opened. Do not have this trouble with hen hatched chicks.—Subscriber, Tulare.

It is usually a sign of roupy parents when the chicks' eyes stick shut, but as you say it is only your brooder chicks that are affected in this way, it may be caused by dust in the brooder or lime dust in their run or a slight cold from being overheated, or possibly from mites. Discover the cause and remove it. Bathe the eyes with a weak solution of boracic acid, half a teaspoonful in half a cup of water that has been boiled. Sometimes it may be necessary to gently grease the outside of the lids with a little lard, but usually bathing the eyes with the boracic solution is all that is necessary.—A. B.

Aphis.

I enclose stalk of bachelor's button which is infested, I suppose, with green aphis. All of these plants are affected, but few others in the garden are.—Subscriber, Watsonville.

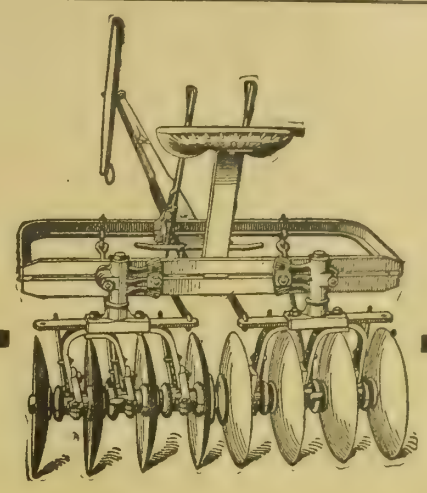
This was aphis, and a good healthy specimen as well. Almost any weak spray will answer, strong soapsuds, tobacco solution, or distillate emulsion. Unfortunately the pest is persistent and may return in a few days in full force.

To Pick Ducks.

In response to recent query in Cultivator I submit following: As soon as ducks are killed dry pick them, removing all large feathers. Dust powdered rosin into remaining down, dip the birds into scalding water, let cool an instant, dip again, then wrap in cloth and let them steam a few minutes. This melts the rosin which hardens when again exposed to the air, matting the down together so it may be removed in large flakes. Next singe the birds, afterward scrubbing in warm water with soap to remove grease and smoke. Rinse thoroughly in cold water. This is an easy and efficient method and one used by professional pickers.—Mrs. C., Tulare Co.

Blight of Tomatoes.

Tomato vines are affected with some



Cotton King Disk Harrow

This harrow is symmetrical in design and strong enough to withstand the heavy work which a disk harrow encounters in a field. It is equipped with three steel standards, which insures great strength and will not clog when working over freshly-plowed ground or among clods. It will work equally well in any condition of soil, no matter whether the field is sandy or soggy. The gangs respond promptly to the levers so that the driver can easily adjust the disks to work at any desired angle. The frame is high and the disks can be so extended that there will be ample room for passing the plants when using the harrow as a cultivator. The levers do not extend below the tongue where they would interfere with the plants being cultivated. This disk harrow is just what you need. Come and investigate.

sort of blight. They have green fruit and have had plenty of water, yet they wilt and curl up even when vines are strong and vigorous. They ultimately turn yellow and die.—L. K. B., Porterville.

This is plainly a case of fusarium or tomato blight. If it is the socalled "summer blight," there is no practical help known. The fall blight, which affects leaves, may be controlled by spraying with a weak Bordeaux, say 5-5-50, but this latter trouble usually comes with the first warm rains of the fall. Summer blight affects the roots, and the only hope is clean and healthy plants set in soil which has never shown the trouble.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Inheritance of Homestead Right.

A wife has homestead and dies without will, leaving husband and children. The husband sells the property. Do not the children have rights in it and can they secure them now?—Subscriber, Lompoc.

If the property was the separate property of the wife, and she did not join in the selection of the homestead, it would descend to her heirs, and the children would nave an interest in it the same as though it had not been homesteaded. If she joined in the selection of the homestead, it vested absolutely in the husband on her death, and the children would have no right therein, except as heirs of their father, and he could dispose of it to suit himself, during his lifetime.—E. L. P.

Taxing Desert Claims.

A man has a filing on 160 acres of desert land. Has not yet made final proof. Can the county tax his possessory right? If so, can his water stock be sold for the taxes?—Subscriber, Holtville.

Government land is not subject to taxation, and the land you mentioned in your inquiry is government land until the final proof is made and certificate issued. The state has power to tax possessory right in land (and this has been construed to cover government land) and can enforce its claim for taxes by attaching and selling the personal property of the party owing the taxes. If there is no personal property, the possessory interest may be sold for the tax. A water right is property and may be sold for that purpose.—E. L. P.

Horse Left in Pasture.

What is the law in regard to horse left in pasture and not called for? Owner never called for the horse nor answered letters regarding it.—Subscriber, Los Angeles.

The civil code gives you a lien on the horse, which is dependent upon possession, but it also provides that if the amount due for the keep of the horse is not paid within twenty days after the same shall have become due, then the lienholder may proceed to sell the property to satisfy the lien and costs of sale, at public auction, and by giving at least ten days' previous notice of such sale by advertising in some newspaper published in the county in which the property is situated.—E. L. P.

POULTRY

1889-1911—Barred Plymouth Rocks, Ocean Blue Strain. Birds of our breeding made a phenomenal record in the hands of our customers this season. Won first place at five of the largest Coast shows, besides many shape and color specials. Fourteen silver loving cups were won by this strain. We won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pen for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—$3 and $5. Mr. and Mrs. D. T. Wieland, Moneta, Cal. Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

All We Know is Rhode Island Red Chickens. But we know them so well that our baby chix, $15 a 100, are the best on earth. There! Pure blood, good strains, well mated by expert breeders. I. X. L. Poultry Yards, 587 Mission St., Santa Cruz, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5 00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Eggs at half price, $2.50 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

Rose Comb R. I. Reds—Eggs one-half price balance of season. A few breeders for sale. Young stock later. Mating list on request. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

White Leghorns—Buff Orpingtons. Bred for beauty and great egg production. Grand lot of both old and young stock for sale. Prices reasonable. Write your wants. Model Poultry Farm, Box H, Irvington, Cal.

White Leghorn Pullets—Heavy laying strain. We have 150 first class pullets, two-thirds grown, which we are going to sell at once. Prices reasonable. Few cockerels. Grand View Poultry Ranch, De Luz, Cal.

White Minorca Hens, 40 thoroughbred heavy laying strain, $1.25 each. Cockerels same price. W. W. Ellis, R. D. 3, Watsonville, Cal.

POSITIVELY NO LIMIT OR RESERVE.

TERMS: CASH.

RHOADES & RHOADES
830 South Main St. Los Angeles
AUCTIONEERS.

SELLING RAPIDLY.

Judging from the number of farmers in this immediate neighborhood who are leveling and checking their land for alfalfa, the Atwater district of Merced County is to become one of the largest alfalfa sections in the State. Hitherto the sandy loam of this district has been devoted chiefly to growing sweet potatoes, tomatoes, peaches and grapes. Returns from these products have been enormous. However, the market for such things is most uncertain and the local farmers are coming to realize that a staple crop such as alfalfa, with its attendant possibilities in the way of dairying and hog raising, pays best in the long run.

Over 1000 acres will be planted to alfalfa this fall in Merced Colony No. 2, a tract of sandy, loam land lying north of Atwater. V. H. Gerard, local manager for the Co-operative Land & Trust Co. of San Francisco, which is colonizing this tract, said yesterday: "The demand for alfalfa land in this part of Merced County is greater than we have ever known before. Of course, there are more settlers coming to California this year than ever before, but the proportion of those who want alfalfa land is way ahead of any previous year."

A TRACTOR ENGINE.

As a factor in farm development there is nothing to compare with the modern tractor engine. It is the embodiment of power; the iron horse, the stalwart mover of things movable. A tractor will do the work of several dozen horses, keep at it day after day, never tire, and accomplish more work at less expense than by any other method.

The tractor engine is the farm-horse of the future. As things grow bigger and better; as we step from one improvement to another in rapid succession, we will soon step into the exclusive use of the tractor engine for general farm work.

And so, with a look forward and a thought of how past methods have changed, it is advisable to be prepared in advance for the coming power. You can know about this engine for very little trouble. The Johnson Tractor Company of Sunnyvale has issued a very attractive and readable book covering every phase of the subject. It will be mailed free.

A picture of this latest improved tractor may be seen on page 7 of this issue.

GET THIS BOOK.

It is entitled "Agricultural Pumps" and is issued by the George E. Dow Engine Company, 413 Sheldon Building, San Francisco. It will be mailed free. Every agriculturist should know about pumps. Knowledge of this kind is valuable and worth money. When you can get this information free, just by writing for it, there is no excuse for not accepting this opportunity.

---The Largest, and Lowest-Priced Furniture House in Western America

Our immense store—more than 150,000 square feet of floor space (to be increased June 1st by an addition of another great eight-story building, half as big as our present building), together with our mammoth warehouses—in all more than 500,000 square feet of floor space—contain the largest stock of furniture, carpets, Oriental and domestic rugs, draperies, wall papers, upholsteries, mattresses and bedding, linens, stoves and household wares, china, glassware, etc., etc., in the United States.

We pack goods carefully and ship promptly to any point.
It will pay to buy of us if you live anywhere west of the Rocky mountains

Write to us, if you cannot visit our store in person. Our Mail Order Department will furnish prices on anything you may need in our line, with pictures or photos of furniture if necessary.

GOOD MORNING.

Day dawns, and bids the blushing sky
"Good morning!"
The flute-voiced birds take up the cry:
"Good morning!"
And nearer home, beneath the eaves,
The gnarled old maple's tender leaves
That shivered in the midnight rain,
Now whisper at my window-pane:
"Good morning!"
The genial sun peeps o'er the hill
And laughs across my window sill.
Eyes quiver under sleepy lids—
This is the King himself who bids
"Good morning!"

I rise and ope the window wide.
The sun-kissed breezes charge and ride
Straight through the breach in merry rout,
And scale the walls and fairly shout:
"Good morning!"
They make me captive to the King,
They pluck at me and bid me sing
Their paean to the Golden Day,
Whose conquering slogan is their gay
"Good morning!"

They frolic here, they scamper there,
They clutch the singing birds in air,
On all the world their music beats
Until the captive world repeats:
"Good morning!"
Heart calls to heart. The surly wight,
Who scorned his neighbor yesternight,
With smiling visage stops to greet
That neighbor in the busy street:
"Good morning!"

O joyous day! O smile of God,
To hearten all who toil and plod,
We hail thee, Conqueror and King!
We hug our golden chains and sing:
"Good morning!"
—Catholic Standard and Times.

HOW BALAAM ABETTED.

Lydia Felicia Perkins.

The sunlight lay like a hot, white blanket over everything, and when there was even the excuse of a breeze the powdery dust whirled and settled like sifted flour on the drooping vegetation—the dog days had come.

Nancy Banks was sitting in a low rocker under the honey locusts, sewing; her father, near at hand, was mending harness. He was a big, stout man, and his open collar revealed a sinewy neck streaming with perspiration, but Nancy looked cool in her pale blue gingham. A charming face, Nancy's, but just at present pouting, and her voice was pouting, too—if anyone may use the expression—as she exclaimed:

"Pa, I don't know what ails you to be so ridiculous. Looks like"—and her eyes flashed as she chuckled—"you want to make yourself the laughing stock of the neighborhood."

Her father's red face grew redder as he tugged at the long needle, finally bringing it through the tough leather with a jerk.

"Well, Nancy," he said slowly, "you know what I've said. I don't know anything against Reub Martin beside him bein' as poor as turnip greens. Ascordin' to my notion, Sam Jackson's as good as he is, and a blame sight better chance."

"Better chance!" she echoed bitterly. "I can't bear him, Pa. I don't like the set of his mouth. There's a look about it of a man who'd beat a horse or bully a woman."

"Well, I ain't a judge of mouths, an' Reub has the chance of winnin' or losin' you," her father said, and shook with a laugh. "That is, if he ain't too proud stomached. Not many men who didn't want a son-in-law would give 'im the chance I have." His eyes gleamed with malicious fun.

"Well, if he'd do such a thing, I wouldn't let him," she cried with excitement and anger. Her fingers fumbled blindly with the delicate ruffling she hemmed. "Just think of the sport folks would make at you two racin' 'long the road——" She stopped, choked with tears.

Her father looked very implacable, for all of his fat.

"Nancy," he said brusquely, "if a man hain't willin' to stand a little foolin' and funnin' to git a gal, he hain't any grit, an'tomorry evenin' is Reub's last throw. I'll give him a fair start, seein' that you two have to go in a buggy, but when you've crossed the creek I'll let Balaam have his head, and if I catch up with you Reub Martin must stop courtin' you." He got to his feet and wabbled away to the stable, looped about with harness.

Nancy bent smarting eyes over the dainty dress she was making. The reasonless singing of a grasshopper in the scorched field to her left irritated her, but the unlatching of the gate and the coming of Sam Jackson mounted her irritation into inhospitality.

"Good evenin', Miss Nancy. Pa home?"

"Yes, he is!" truculently.

"I'll just sit down and wait for him."

No answer.

He seated himself in Banks' vacated chair, swung his big, booted right leg over his left, and looked under his drooping slouch hat straight at Nancy. He was thinking.

"What a fine lookin' girl she is! The peartest in the county." His light eyes kindled. Then he spoke aloud.

"Say, Miss Nancy, did you ever see my place down near the crick?"

"Yes, and it looks mighty run down and neglected," she said frankly.

He fingered the strap on his bootleg and dropped his voice.

"It needs a woman in the house," he began, significantly.

"And a man in the field," she ended unkindly.

He bit his lips, but tried to laugh. He rose and took off his hat to brush back his hot hair.

"I won't wait for your pa now, Miss Nancy, but I'll be around tomorrow night." He stood over her, looking down into the flushed, rebellious face. "I want to see you tomorrow, too," he added, with meaning in his voice.

She answered nothing, and he vaulted to the saddle of his horse, giving a last, unreadable look, while the mouth she didn't like twitched disagreeably, then he struck his horse with a sudden sharp blow and went away at a gallop.

When Reub Martin came that night, Nancy told him what her father had said. He was a big, lithe fellow, with a curly head like a bed of live coals, and eyes of burning blue. To Nancy's surprise and annoyance, he laughed and answered:

"I'll take my chances, sweetheart."

"And be the laughin' stock of the county," she sobbed.

"No, shucks, Nancy!" he said heartily. "I guess I can stand a little bit for you. Nobody would laugh at you, Nancy." He bent his face to her tearful one fondly. "And every other fellow in the neighborhood would want to be in my boots so bad they'd be just mad at me."

"Sam Jackson's coming over tomorrow night," she went on gloomily.

Reuben's eyes sparkled.

"Nancy," he said with steady lips,

WHAT IS YOUR POULTRY WORTH?

It has a value, but that value is determined by and dependent upon health conditions. Best and surest poultry health can be obtained and maintained by using

GERMOZONE

A preventive and cure for Roup and Cholera unequaled in efficiency. Germozone is a germicide, a cure and preventive of Cholera and Roup. It is a system builder. It goes to the seat of trouble and usually effects a permanent cure.

Given in the drinking water *twice a week* it cures disease, prevents contagion and keeps the fowls in a healthy, vigorous condition. Prepared either in tablet or liquid form, 50c. We pay postage on tablets.

Germozone is the best health insurance you can have for your poultry. Cost is small and it is sold on *an absolute guarantee.*

Germozone is not an experiment. It has been doing for years for Mr. Lee just what he is telling it will do for you.

LEE'S EGG MAKER

is not a medicine. It is a scientific food product compounded by Mr. Lee, who is a *poultryman* of 25 years' experience. If it were not for the success claimed for it Mr. Lee would never have offered it to the public. That is one broad, sweeping assurance any poultryman has who buys Lee products—they know his own flock has demonstrated their worth to him.

READ THIS GUARANTEE

We guarantee that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if Lee's Egg Maker is added to the daily ration—made a portion of it—the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and 100 per cent profit on said labor.

25c, 50c, $2 sizes. The smallest size is large enough to prove you ought to buy more. A larger size would do it quicker—and you would get a little more in proportion to the price.

Write for free copy Lee's "Chicken Talk," written by Geo. H. Lee himself. Also free Mandy Lee Incubator catalog. Yours by first mail.

"promise me you'll take your father at his word and go with me when it comes to the time. Then when Jackson rides up here tomorrow, we'll be to town havin' the knot tied."

"If pa don't catch us," his sweetheart broke in dolefully. "He's goin' to ride Balaam." With a fresh burst of woe. "He's the fastest mule pa's got."

And some of Reub's good spirits deserted him, though apparently he was stout-hearted as ever.

The next afternoon, promptly at three o'clock, Reub Martin drove up to the Banks' front gate, swung out of his new buggy, and came into the yard. When the gate latch clicked, Nancy, in her pretty white dress, her cheeks as colorless as the lawn, appeared on the front porch. She hesitated there and looked as though she would retreat, but the sound of her father's shout in the horse lot, where he was saddling Balaam, set her in her resolution.

"Come, dearie," her lover called, gently. He looked tender and trustworthy and comely in his blue suit—his newly shaven face healthy and attractive.

With a little sob, Nancy ran to him, and he lifted her up in his arms, held her against his breast passionately for a moment, then placed her in the buggy and seated himself beside her.

He turned a smiling, dauntless face to Banks, who stood grinning by the side of the ready-saddled mule.

"Good day, sir!" the young man called, and lifted his straw hat.

Banks shook his whip gayly after the receding buggy, and watched it till he saw the wheels splash up the water in the creek. The horse stopped to drink, then crossed to the other side and began to mount the opposite hill. Now was Banks' turn. He threw himself into the saddle, stuck the spur deep into Balaam's pampered side, and loped down the road, a grim mirth in his face.

There seemed to be no question as to the outcome. Banks shouted gleefully to the fugitives, and plowmen following a languid furrow paused to watch the unique race. The dust spurted up from the hoofs of the mule, and he tucked his head down and turned back his wicked ears and drew a cranky stitch above his twinkling eye, then with a heartfelt snort plunged into the clear water of the sandy creek, and paused with such abruptness that Banks nearly went over into the water. And there the mule paused, and while the father strove in vain with the obstinate animal the elopers looked back at him with childish simplicity; and, waving good-bye, hurried on to the next town and were made one.

For a while anger occupied the mind of Banks, then suddenly amusement took its place, and he turned the head of Balaam, who moved nimbly enough in the direction of home.

He had just turned Balaam into the lot and was making himself comfortable under the honey locusts when Sam Jackson cantered up to the gate, his horse in a lather.

"I want to tell you," he said, breathing fast from hard riding, "that I met Miss Nancy goin' to town with Reub Martin in his buggy."

Nancy's father looked at the perturbed suitor—at his painfully spruce attire—then a slow, appreciative smile spread over the waves of fat.

"You did? P'r'aps you might have. She and Reub went to town 'bout a half hour ago. They're married by this time."

"Married! Why in blazes didn't you stop 'em?"

Banks looked thoughtful.

"I did allow to, but my mule was dead against it. He balked at the ford. You remember the Bible tells us about a donkey that once stopped because an angel stood in the way? I calculated today Balaam must have had some mighty good reason for stoppin'."

"Oh, go eat grass!" Jackson screamed, whirling about his astonished horse. He struck the unoffending brute several vicious blows over the head, jerked its mouth cruelly when it reared, then dashed away in a cloud of dust.

"Nancy was right," said Banks, looking after the furious rider. "A man that lets his spite out on a horse wouldn't treat a woman right. 'A merciful man is merciful to his beast.'"—Farm and Ranch.

STURDY TOOLS FOR TRYING JOBS
Here is a Keen Kutter Fork—a sturdy bit of springy timber, tipped with three properly curved tines of finest steel, tempered like a watch spring. When this fork is sunk into a well settled bunch of long hay, a man's strength is needed at the end of the handle.
KEEN KUTTER
Farming Tools
—hoes, forks, rakes, scythes, axes, spading forks, corn knives, shovels, spades, ditch tools, manure hooks, potato hooks and bush hooks—are all remarkable for their working capacity. A brawny man and a Keen Kutter Tool is a combination hard to beat when it comes to actual results in work accomplished.

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A lobe tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Hay.

Scott, Magner & Miller say:

Receipts of hay for the week have been 2400 tons, which is about the same amount as for the preceding week. Considerable of this hay arrived by boat; the arrivals by railroad have continued to be light.

We have been receiving a few cars a day of the new crop hay, but the prices that have been realized therefor have not been satisfactory to the dealers, as it has been difficult to place the hay here on a basis of what has been paid for it in the country. Apparently the asking prices in the country at the present time are a little higher than the range of the market here in the city.

The new hay that has been arriving shows good quality, and appears to be above the average of last year's harvest. This is particularly gratifying as most of the consumers have been calling for a better grade of hay than they used to require.

There is no change in the alfalfa hay market from our last advices; there is very little coming in, and the demand is light.

We quote the wholesale prices in round lots on old crop on today's market as follows, viz:

Fancy wheat hay	13.50@14.50
No. 1 wheat or wheat & oat	11.00@12.00
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa	9.00@10.50
Straw, bale	40@50

Grain.

Wheat	1.42½@1.50

Mixed feed, ton	25.00@27.00
Shorts	29.00@30.00

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, June 30, 1911:

Cherries—30¼ cars. This shows a considerable decline from last week's shipment, which amounted to 46 cars. Shipments will dwindle rapidly from this time on, as there are but few more cars to move.

Apricots—67½ cars. Not as much fruit of this variety was shipped this week as last, the difference amounting to practically 10 cars. The heavy movement is now over and shipments will decline rapidly. There will be a few cars available during the coming week.

Peaches—56 cars. A slight increase in the shipment of peaches is noticed, but it does not amount to a great deal. Triumphs are now nearly all shipped. There will be no considerable quantity of them to come in after this week, although one or two localities will have a few. St. Johns and Hales have made their appearance, but there will be very few of them available during the next seven days. After that the movement should be liberal.

Plums—71½ cars. This variety of fruit is now moving in liberal quantities and comprises many of the best known varieties, such as Climax, Burbank, Abundance, Shiro, Red Junes, Tragedy and Simoni. Shipments are probably as liberal now as they will be at most times during the season. The crop is good and quality is better than usual.

Pears—4¾ cars. There are some Bartletts going forward, but the movement is not heavy yet. It will increase from day to day, and by the 12th of the month the volume of shipments should be enough to meet all requirements. Fruit is clean and of good size.

The grape crop continues to look very well. No mildew or other trouble has appeared to injure the prospects, which are unusually good.

Weather is now settled into the regular article common to California summers—warm, pleasant, and in every way desirable for perfect maturing of fruit.

Citrus Fruit Market

LOS ANGELES, July 5, 1911.

The demand for Fourth of July fruit having passed and large quantities of other fruit filling the market, there is a slight weakening or shading of prices on Valencias. Some sales are still made at full quotations in favored markets and for exceptionally fine fruit. There is no intimation whatever of any material decline and within a week or two probably normal conditions will prevail.

The extremely hot weather has given a great boost to the lemon market and even indifferent fruit is commanding stiff prices.

Shipments.

Shipments of oranges from November 1st, 1910: 32,765 cars, lemons 5,142, total 37,907. To same date last season: Oranges 22,549 cars, lemons 3,546, total 26,095.

LOS ANGELES, June 30.—Seven cars Valencias sold.

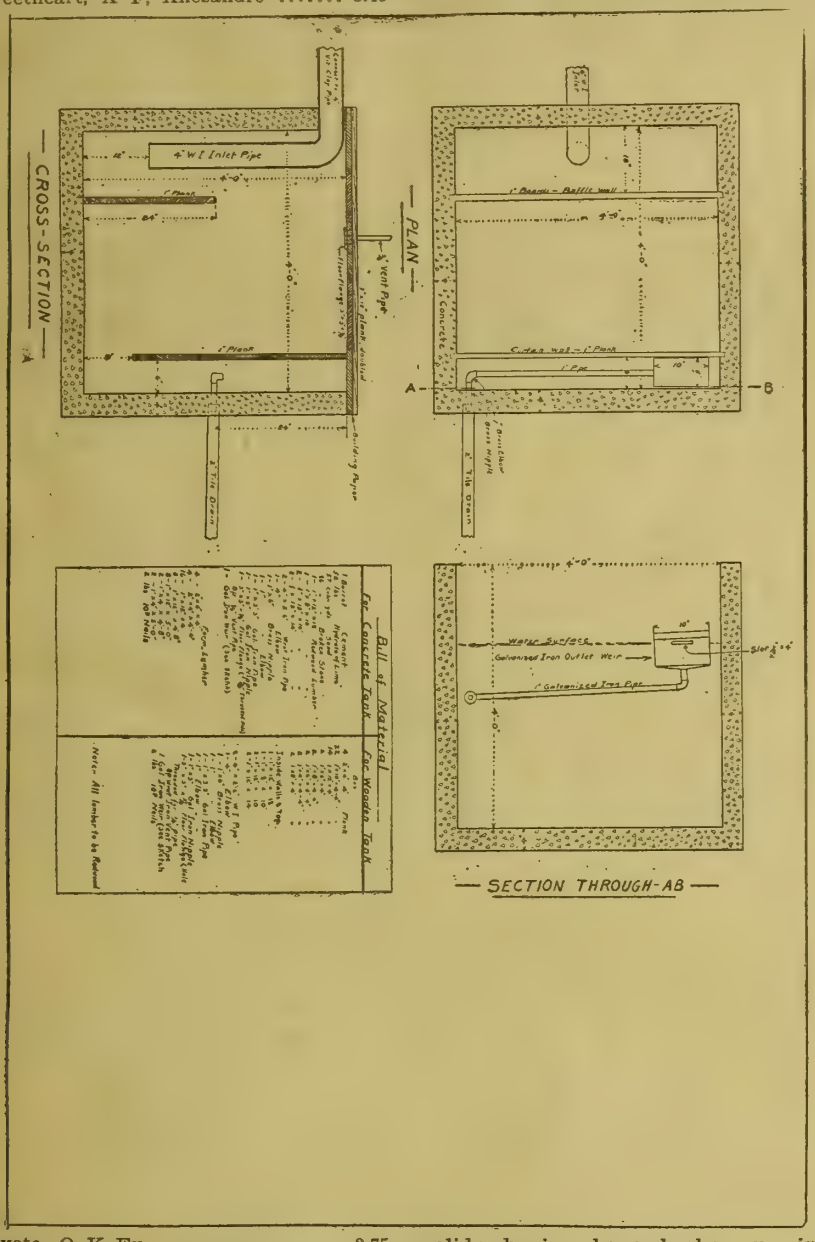
SMALL SEWAGE DISPOSAL WORKS

(Continued from Page 3.)

pense. The drawings given are of a septic tank estimated for an ordinary farmhouse with a family of from five to eight. It should accommodate the wastes from the toilet, bathroom, kitchen and laundry-tubs. The supplementary drawings show this tank combined with subsurface irrigation tiles.

The sewage flows from the house into the septic tank through the "inlet pipe," and is held there by the "outlet weir" for ten or twelve hours. During this time the solid bowel-discharges and other organic materials in the sewage are worked over by the "anaerobic" bacteria. The heavy inorganic "sludge" settles to the bottom of the tank and the lighter separated portion rises to the top to form the leathery "mat." If the tank works well, however, these two constituents are very small in bulk, most of the solids having been broken up into gases, materials which dissolve in water, and very finely divided particles which remain suspended in the water and pass out with the effluent.



The tank shown in the diagram is constructed of concrete.

The "soil pipe" from the house should be 4-inch vitrified clay, bell and spigot-jointed pipe. The cementing of these joints is specially important in the vicinity of trees and rose bushes, as their roots will utilize every opportunity to wedge into the joints. The outlet-weir is a simple device so arranged as to permit a constant discharge regardless of the intermittent inflow of the sewage from the house. If subsoil irrigation is planned, the effluent should be carried in loose jointed 2-inch tiles placed 12 to 18 inches below the surface and having a fall of from 2½ inches to 3 inches to 100 feet. In sandy soil the distributing pipes should total approximately 200 feet, in less absorbent soil the amount of distributing pipes must of course be increased.

The tank does not require a roof, though one may be provided as a matter of safety or appearance. Successful tanks have often been operated for six or eight years without being opened, though the majority of them accumulate enough heavy sludge in three or four years to make it desirable to clean them out. The sludge so removed may be readily disposed of by spading it into adjacent ground. The Kansas Board of Health in a similar discussion of the subject, previously referred to, states, "Particularly for those parts of the state where the rainfall is so small that the water of the sewage, as well as its fertilizing constituents, has an appreciable value, the disposal scheme outlined above may have a considerable economic as well as sanitary value. It is quite possible by this method to maintain in the dryest region a large, well fertilized, and well-watered lawn. The process should be carried on entirely without odor, though, of course, the septic tank should be located some little distance from the house—say a hundred feet or more, if possible. Particularly the disposal plant should not be near to any open well which is used as a source of water supply."

The expense of this suggested plant will vary in different parts of California. Any one can obtain prices, however, on the materials given in the diagram, and can accurately estimate the cost in his locality. In many parts of the state this cost would not exceed $25 to $30.

Showing plowed ground with rich subsoil unused — Same ground after subsoil has been dynamited

DOUBLE THE FERTILITY OF YOUR FARM

By Breaking up the Rich Subsoil

WITH

DU PONT

RED CROSS DYNAMITE

Ordinary plowing turns over the same shallow top-soil year after year, forming a hard and nearly impervious "plow **sole**" that limits the waterholding capacity of the land and shuts out **tons per acre** of natural plant food.

Dynamiting the subsoil makes this plant food available, aerates the soil, protects vegetation against both drouth and excess rainfall, and soon repays its cost in **saving of fertilizer expense** and **largely increased yields.**

Write for Free Booklet

To learn how progressive farmers are using dynamite for removing stumps and boulders, planting and cultivating fruit trees, regenerating barren soil, ditching, draining, excavating, and road-making. Write now for Free Booklet—"Farming with Dynamite, No. 164

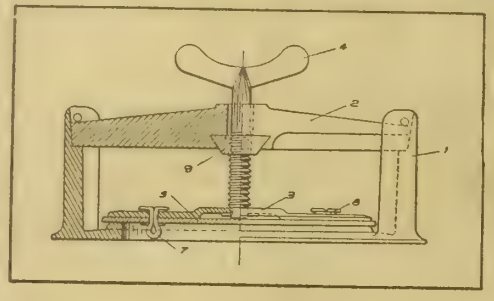
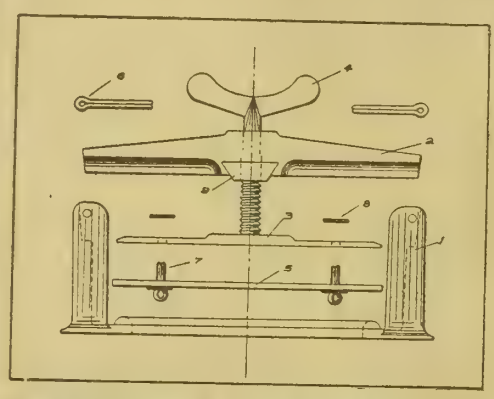
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

No Hoof-No Horse

Statistics show that 80 per cent of all horses are lame, and that 80 per cent of the lameness is caused by hard and contracted feet. Especially is the dry season in this section very hard on hoofs. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for tender, brittle, hard and contracted hoofs, split hoofs, quarter cracks, mud fever, scratches, corns, cracked heels, grease heels, and for all kinds of sores and cuts anywhere on any stock. It will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Send for Folder with many testimonials of big horsemen, vets and others. Or better accept our

TRIAL OFFER.

We will send you a 2 lb. can; use it 15 days, and if satisfactory send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk; you just try it. Send for it today.

Rural Out-of-Door Adornment

An Address Before the Pacific Coast Nurserymen's Convention by Johannes Reimers, Stockton

There is considerable agitation in the larger cities of the new world in favor of breathing places, playgrounds and parking of streets and squares. Some cities have large and beautiful parks, others are contemplating and planning such. We hear comparatively little about beautifying the country. Perhaps it is because it naturally is so much more beautiful than the city. Yet what looks more hungry than miles and miles, yes, hundreds and hundreds of miles of dusty or muddy country roads without a tree to lend its hospitable shade to the weary traveler and gladden his sense of beauty, give relief to his tired eyes. What is more homely than a country school house with its barren windows staring at you, rising unconnected with the land upon which it stands with its bare painted walls and not a tree or a shrub to make it look homelike and inviting. And almost still worse—what is more uncivilized, more hopeless, more desolate than a farm house standing in utter loneliness in the endless grainfields with their summer glare without a climbing rose over the doorway and a bed of posies in the front yard and protecting arms of friendly trees reaching over the roof. Can you imagine anything more uninviting than a village where the street is unplanted and the heat of summer reflects from dusty soil and glaring housewalls, where the front yard is as unkempt as the backyard, where on account of the lack of trees and flowers you judge its inhabitants mean and stingy, uncultured and emotionless, where life cries to you as a mere miserable existence.

Nature made the country beautiful. Man has done his best to destroy its beauty. For he has constantly taken without giving. And yet—it is the country home—the rural district where lies the nation's hope. It is from there it must expect its best blood. It is from there it expects its honesty and integrity with its bread, why should it not from there also expect its fundamental culture?

There are two vital reasons why rural out-of-door adornment is most desirable.

The first is the ethical reason.

The second is the simple commercial reason.

I believe that the first is the most important. Barren life surroundings, a childhood robbed of beauty, a motherhood with nothing but daily duties, means barren souls. And yet this is often the condition on the farm.

I believe I have found in every human being with whom I have become acquainted an inborn love of the beautiful. I believe the love of the beautiful to be the greatest saving power of humanity. The love of the beautiful brings with it gentleness, kindness and tenderness. More than that, it is the haven of rest for the tired mind. It stands back of all art inspiration and all art expression. A home in which there is but the constant striving for money or even merely for bread, where the beautiful is forgotten and absent, is never a happy home. Even the wild bird adorns his nest. In a home where beauty is not inherent the desire therefor is soon forgotten. Its results are a hard grasping nature and a small selfish life often spiced with the poison of slander, and very apt to be immoral. We are busy people. We are upbuilding a great new land where nature has outdone herself for us. We have gone into the wilderness not alone with the plow but also with the ax and the gun and the sword. We have set fire to woodlands and wild pastures. We have cut down our great stately oaks of the valleys. It is time for us now to plant trees lest coming generations curse us for robbing them. Will it pay us to do it? Ethically it will encourage our inborn love of the beautiful, it will make us better, cleaner, bigger and more capable in every way. Have you noticed the wonderful inherent power of imagination in children? Give them life surroundings bare of beauty—a barnyard instead of a garden to play in, and their ever-seeking imagination will lead them into a barn-yard life. Give them trees and flowers where birds and butterflies come, and long shaded highways to school and between the homes. In their school yards plant trees and shrubs and flowers from many lands, and you will find open glad eyes to meet you, eyes that are wondering and seeing far, and back of them souls which go on far journeys to these far lands whence the trees came, and of such souls are the truly great men and the great women in the world—the great in art, in literature, in humanity, in home and in the nation, to such belong the names which live with us from past ages, and the names to come which shall not be forgotten. I am not a pessimist, yet do I expect to see in the young generation which shall take the land after us very much thoughtless frivolity and very much lack of respect for anybody. There is a reason for this. But this is not the time and place to discuss it.

The beautiful pays. We are inviting people from the East and other lands to come and share our acres with us, to build homes, to till our fruitful soils, to enjoy our mild winters and healthful climate. We want the best kind of people to come West. We also want people of wealth to come here. We would like to make the lands west of the Sierra the playground of the nation; we want people to come and spend money among us—how can we better do it than by tending to our rural out-of-door adornment? In this paper I am particularly speaking of California, for it is the only land of the West I really know.

Every farm house should have planted about it beautiful trees. These need not be only ornamental. With the small subdivisions of land that are rapidly coming on it is perhaps important to make beauty practical and remunerative. But what great and stately trees are there not that are also fruit-bearing? Take the walnuts with their majestic spread of crown, what a background for a farmhouse, and their cousins the pecans and hickory, and surrounding a group of such the charming chestnuts of the old world and the new, and of the Orient! And to lend color to such a planting a crabapple tree with its load of delicate fragrant flowers in spring and its load of little richly colored apples in autumn. Then for a contrast in foliage a couple or three of the Prunus pissardii or Burbank's Vesuvius, which is still more handsome, and against the dark green of the walnuts a few large-growing varieties of figs rich in fruit and large gray-green foliage, and to finish up the group and give it outline, some Japanese persimmons clustered in with loquats and also a cluster of orange trees in several varieties running into a low shrubbery of purely ornamental character, with roses in abundance, and as screens hiding ugly features, bamboos, these great graceful grasses whose practical value we yet so poorly appreciate; and separating the garden from the farm either a free planting of shrubs and berries or a hedge of everblooming roses or of pomegranates with their delicious and refreshing fruits, or any one of the many other shrubs suited for hedging. And let me say it here, I think an untrimmed or rather unclipped hedge of flowering shrubs so far more beautiful than a hedge clipped into artificial symmetry, that from an artistic standpoint there is no comparison. Above all keep the formal or symmetrical garden away from the farm. It might have its righteous place as part of classic architecture and tiled court-yards in city surroundings. The farm garden should above all look free and natural, thus its trees and shrubs should never under any circumstances be planted in rows but freely as if put there by nature herself as a part of the surrounding free country. There are people who think a garden is no garden at all without a lawn. I must disagree with them. It is just as beautiful to have groups of shrubs with their flowers and forms and flanked by handsome perennial flowering plants and borders of annuals. And they are far less care when established, of constantly increasing beauty, far more interesting in every way than is any little patch of lawn. Of course, where one can have a good sweep of grass surrounded by trees and shrubs and flowering plants it is an entirely different thing. Then the lawn becomes a part of the landscape; but in the other case it is simply trying to be something it is not, and that in gardening is as bad as in anything else.

Around the school houses the trees should be both ornamental and instructive. For such planting both the industrial value should be considered and also to some extent give a lesson in imagination or even in geography.

Eucalyptus and acacias might tell of far-off Australian woodlands. Camphor trees, bamboos and cryptomerias and a few of the many shrubs that have come to us from Japan might give pictures to the child of that far-off country. The deodoras would give an idea of the forest of the Himalayas; the pines and spruces and maples and birches of the forests of the northlands and our own high mountains, even a little cement lined or puddled pond by the pump might illustrate the flora of some far-off river banks of some far-off country—thus send the child's mind off on far flights to widen the scope of its views to develop its all-important power of imagination.

The only way of undertaking a systematic planting of trees along our highways is to do so under municipal expense, control and ownership. It is the only way to get such plantings, the only way to get them systematically maintained and cared for, the only way to hold the marauder responsible. For that reason every county should have its forester, paid by the county well enough to induce men of knowledge and capacity to seek such positions. It seems to me the simplest thing in the world, and the only practical way. He should be allowed a fund to work on as is the superintendent of highways or the supervisor. It would even perhaps be well to have a state forester of highways, under whom the county foresters should work so as to insure a systematic and intelligent and connected planting the state over.

These plantings along the highways need not be purely ornamental. I have seen long stretches of excellent highways in Europe planted with fruit bearing trees such as apples and cherries and walnuts. The fruit from these trees paid for their culture and care and often for the whole maintenance of the road along which they were planted. This could also be done largely here. Where the roads are unusually wide and the soil either naturally moist or within easy access of watering the roadsides to some extent could be parked. That is, instead of planting trees singly they might be planted in groups of three and of a number of different varieties inter-planted with hardy and beautiful

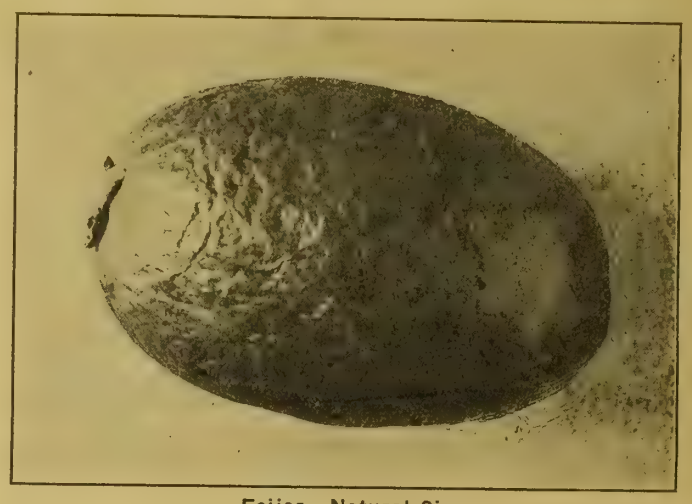
Citrus and Tropical Fruits

THE FEIJOA: A COMMERCIAL POSSIBILITY.

By F. W. Popenoe.

The feijoa is one of our more recent acquisitions of a subtropical nature which gives promise of becoming of commercial importance in the near future. While native to southern Brazil and Uraguay, it has proved hardy wherever tried in California, and is even grown outdoors in England, so that the area in which it can be grown in this country is necessarily a large one, and the question of hardiness, always an important one with introductions from tropical countries, is satisfactorily disposed of. It has been grown in California for ten years, and thoroughly proved its adaptability to this climate in every respect. But like almost all other fruits, when grown from seed it is liable to considerable variation; thus many of the fruits produced here have been of inferior quality. The only thing needed to set it on a firm commercial basis is the propagation of some of the finest varieties by some vegetative means. When this is done there is little doubt that the feijoa will take a place among California's commercial products, and the fruit will be shipped to all parts of the country. To be a commercial possibility, a fruit must be absolutely dependable in regard to quantity and quality of its crop, and this the feijoa in the seedling form is not.



Feijoa—Natural Size

In growth and character the feijoa (pronounced, according to the Century Dictionary, Fay-zho-a, accenting the middle syllable) much resembles the common guavas. It is in fact closely related to the guavas, all being members of the natural order Myrtaceae, or myrtle family. The plant grows to an ultimate height of eight or ten feet, making a very ornamental shrub, with brilliant and attractive flowers, silvery white in color, with a tuft of crimson stamens tipped with golden anthers, and foliage of a pleasing combination, glossy green above and silvery white beneath. Planted as a hedge it combines utility with beauty.

The fruits are about the size and shape of a hen's egg, green in color, with sometimes a touch of crimson on the cheek. The skin is thin, as in the case of the guavas. Next the skin is a layer of granular flesh, which surrounds a quantity of white, translucent, melting pulp, in which the seeds are embedded. The flavor of the fruit is one of the most delicious imaginable, combining the flavors of pineapple, raspberry and banana. This flavor combined with the aromatic odor which the fruits possess, is sure to be a winning combination. The seeds are from fifteen to thirty in number, and are so small that they cannot be felt in the mouth, being in fact no larger than strawberry or fig seeds.

The fruit is commonly eaten out of hand, but it can be cooked in almost any way, crystallized, made into jams or jellies, or prepared in numerous other forms, in any of which it is delicious.

The season of ripening is from November to January, but the fruits do not ripen on the bush. They will fall when mature, and can be then taken into the house and laid away for a week or two, when they will be in a fine condition to eat. They keep for a remarkable length of time, and can be shipped to any part of the country in perfect condition.

The culture of the plant is simple, and no difficulties of this nature will be encountered by any who attempt to grow it. While frequent irrigation during the dry season greatly encourages growth, the feijoa is a great drought resister; one of the original plants introduced from France ten years ago, growing on Dr. Franceschi's place at Santa Barbara, has never had a drop of water except from the skies, and yet has made a good growth and is bearing regularly. The plants usually come into bearing the third or fourth year from the seed.

This shrub was first brought to Europe by Edouard Andre, and being found well suited to the climate of Southern France and the Riviera, was planted quite extensively, and the fruit is now produced on a commercial scale. From France it was first introduced to America in 1901, by Dr. F. Franceschi of Santa Barbara, well-known as an economic botanist and introducer of new plants. The few plants which formed the first introduction were distributed over Southern California, and are almost all of mature size and fruiting prolificly and regularly at the present time. Numerous seedlings have recently been raised from them, many of which are just commencing to bear, and among which there is considerable variation in the size and quality of the fruits produced.

There seems to have been some misunderstanding regarding the introduction of this fruit, and Dr. Franceschi has been done an injustice by an ar-

Distillate Engine

Mounted on wood skids, complete with 8 x 6 Pulley, Batteries, Spark Coil, Fuel Tank, Lubricators, Muffler, Wire and Switch.

The Patented Galvanized Hopper for cooling is made of one piece of sheet iron, heavily galvanized all over after completion. The circulation is perfect and evaporation slight, making an ideal cooling device.

They are built in two sizes and both rated well below the power they will develop.

ticle regarding Luther Burbank in a recent number of the Scientific American, in which the feijoa is illustrated and the statement made that it is a fruit never before grown in the United States. Dr. Franceschi's first importation from France was without doubt the first introduction, and these plants have been fruiting here for at least six years.

SEEDLING AVOCADOS.

Wishing information as to the action of seedling avocados in the Hawaiian Islands, where that fruit has been a favorite for many years, Mr. Ernest Braunton wrote Mr. J. E. Higgins, of the Hawaiian Experiment Station at Honolulu, and from him has the following:

"It is difficult to state what percentage of our seedling avocado trees turn out to be of clear commercial value. If you mean by this, what proportion turn out to be superior to those which we already have and which would, therefore, be worth while for further propagation, the percentage would be quite low. I have no accurate records from our station plantings, since these are now just beginning to come into bearing. The percentage of good trees is entirely too small to warrant anyone starting a seedling orchard as a commercial proposition.

"When grown from seeds the resultant trees do not bear fruit resembling that of the parent as closely as do seedling orchards of citrus resemble their parents. There is a very wide variation. Seeds from purple fruit may come green, and vice versa; those from a round or pear shaped fruit may be elongated. There is quite as wide a variation in bearing habits.

"We have succeeded in growing some plants from cuttings, but we do not regard this as a practical means for the propagation of the avocado. In budding we get from 80 to 90 per cent of successful buds on strong seedling, nursery or orchard trees when about one and a half or two years old. A well grown tree might be budded when it is a year old. In top working orchard trees the percentage may fall to as low as 50 per cent, but we expect between 60 and 75.

"We bud in nearly every month in the year if the trees are in such condition that the bark will slip. The months which we prefer are from January to July, and the earlier in this period the better. Our trees begin to put forth new growth about December or the first of January.

"I am glad to learn of your observations on avocado in California and to find that it does not appear to be too tropical in character for your climate. If it proves to be adapted to any large areas in California, it will certainly become an important industry."—J. E. Higgins.

Plainly it is a mistake to plant seedlings excepting with the expectation of working over.

ANNUAL PICNIC.

Prof. A. J. Cook, President of the Claremont Pomological Club, hands in the following, of interest to all who may be within reach of Pomona. He urges all in that vicinity to come with well-filled baskets because with the speaker who is announced there will doubtless be many from far away points to be fed, and Prof. Cook says:

"The Summer Picnic of the Claremont Pomological Club will occur at Ganesha Park, Pomona, July 15th, from 10:30 a. m. to 4:00 p. m. Prof. C. B. Lipman of the State University will speak before and after lunch. Prof. Lipman is one of the ablest men on soil economics and was a star at the recent memorable soil conference in Los Angeles, a fit companion of Dr. King, one of the greatest authorities of the world. Other speakers will be present and the day will be a very important one to all attending."

Deciduous Fruit Culture

PEDIGREED STOCK: DOES IT PAY?

We wish to make correction of the fourth paragraph in the second column of the account of the Pacific Coast Nurserymens meeting at San Jose, which appeared in the Cultivator of June 29th. In that we said:

"Pedigreed stock came in for somewhat of a discussion, but some confusion obtained as to what pedigreed stock is. The discussion was not as interesting as it would have been had not one firm taken advantage of the interest in the subject to advertise itself. We believe that nurserymen should take up the matter of pedigree, but they should also consider that pedigree means something."

As a matter of fact there was no general discussion on the floor of the convention, there being only one address on the subject and that by Mr. Leonard Coates of Morganhill. Reference in the above quoted paragraph to "one firm taken advantage of the interest in the subject to advertise itself" did not apply in any sense to the Leonard Coates Nursery, as it might perhaps be interpreted by those in attendance. In fact, the discussion was more in the halls and hotel lobbies. Several nurserymen spoke to the Cultivator representative along the line of the quotation in Mr. Coates address in the next to the last paragraph given below, "There are nurserymen who would seize the opportunity to advertise their stock by using the term pedigreed without the shadow of reason for doing so justly." The position which Mr. Coates takes below is exactly that of the Cultivator that every step should be taken to discourage the debasing of the word "pedigreed."

* * *

By Leonard Coates.

Nurserymen understand what is meant by "pedigreed stock." They may believe in it or they may not. There has been a good deal of discussion as to the correctness of the term, "pedigreed," as applied to plants. A "pedigreed" animal infers known parentage on both sides. With fruit trees, and other plants the female parent is often known, but not the male, and many of our best fruits are what is known as chance seedlings, both parents being involved in obscurity. Moreover, a flower, or a fruit (using the term "fruit" commercially not scientifically) may be pedigreed in the most literal and scientific sense, being bred by artificial methods, and still be worthless so far as any economic or commercial value may be considered.

The term "pedigreed," however, implies exceptional and fixed quality, and that is what we desire; no other name has been proposed, except "selected," which is meaningless. Pedigreed stock is simply propagated selected plants, whether bud variants, mutants, or by whatever name they may be known by scientists. I will not enter into a discussion of bud variation, or Mendel's theory of mutation, but merely call your attention to the writings of Mendel, Hugo de Vries, L. H. Bailey, and others.

There is at present in Southern California a systematic work being carried on under the direction of an expert sent out by Dr. Galloway of the Department of Agriculture, to segregate certain individual citrus trees which have made a record as to quality of fruit, good bearing habits, and general vigor, and to use these trees from which alone to propagate.

The leading citrus growers believe in bud variation, and its propagation, or perpetuation by budding or grafting, and are working to the end that their orchards may be improved by breeding up. Some growers already are budding over their bearing trees from these individual specimens. Such trees will surely be "pedigreed." An increasing number of fruit growers all over California believe in pedigreed trees, the theory and practice of selecting individuals from which to propagate being warmly upheld by Professor F. T. Bioletti, of the University of California, Mrs. M. E. Sherman of Minnewawa, and others.

Occasionally most distinct bud variations are met with, or sports, which are entitled to the classification of a new variety. My attention was first called to this variation, or individuality, in 1882, when studying particularly what we call "French Prune." I have a water color sketch, made at that time, showing the different types of the French Prune, but all propagated as one. These "types," or variations are just as fixed now as twenty-five years ago, and no one has endeavored to segregate them until I commenced this work in 1905 by propagating only from marked individuals.

But the question arises, "Does it pay?" And this question is paramount with the business man. Few of us can afford to be reformers or philanthropists. It pays, in theory, to sell good goods rather than poor ones. It pays, ethically, to do right rather than wrong. It pays, to some extent, by being advertised as progressive, or, which is generally the case, as a crank. I admit that this is its best feature, commercially. It does not pay when the majority of planters, encouraged by the facetious and skeptical attitude of some leading horticultural journals, regard it as a dose of nurserymen's buncomb, or species of humbuggery. It does not pay when the majority of planters take little or no interest in plant breeding, and even decline permission to examine and mark trees for buds. It does not pay whenever the planter who professes faith in pedigreed stock, refuses absolutely to pay one cent more for such trees, although that would not compensate for the great added expense of procuring buds from trees entitled to be called "pedigreed."

It might be made to pay handsomely, both nurseryman and planter, if the two would work in unison in the effort to improve the standard of our fruits. There are growers, of course, who would do this, as there are also nurserymen who would seize the opportunity to advertise their stock by using the term "pedigreed," without the shadow of reason for doing so, justly. The work, at best, could be but very gradual, although I have already seen a nursery firm advertising "pedigreed" apple trees for sale by the million!

Personally, I believe the work can only be done practically in a small way, by individual orchardists co-operating with some neighboring nurseryman, and thus actually propagating some known and fixed bud variation.

Farmers of Sacramento County are calling for another good roads bond issue.

COMMISSIONER REPORTS.

Ventura County has such an excellent horticultural commissioner that at the time of the delivery of his annual report the fruit growers of the country gather to hear it and engage in a general fruit growers convention. It has been asserted by some of the keenest fruit growers in the state that the Ventura commissioner is one of the best in the state. In "apologizing" for the amount of work he had accomplished, Mr. Essig stated in his annual report that he had been compelled to put in about fourteen working hours every day in the year. Certain it is Mr. Essig is one of the hard working young men interested in fruit growing.

The needs of the commission were fully appreciated by the assembly, and a committee, which consisted of E. S. Thacher, C. C. Elkins, N. W. Blanchard, Geo. C. Power and W. H. Fleet, was appointed to present the matter to the county board of supervisors and urge more liberal appropriation, that the scientific work now being done by Mr. Essig may be continued. The need for this is so great that Mr. Blanchard remarked in the convention that if the supervisors did not see fit to supply funds, he himself would advance the necessary amount.

Mr. Essig's report dealt with the organization of the commission, its business equipment, field equipment, spraying and fumigating outfits, and a description of the experimental work carried on. In addition, he listed the pests affecting the orchards of Ventura County. One of the worst has been the mealy bug, which Commissioner Essig has made his special study, accomplishing what has never before been done, the control and practical eradication of the pest by the use of the new carbolic acid spray which he has brought into use.

Another special work has been with the aphis, of which he is making a regular study. Ventura has not only quarantined some other counties which have pests it desires not, but certain sections within its own boundaries, in order to prevent shipment from mealy bug infested districts.

It is a satisfaction to notice the almost unanimous support which Mr. Essig is receiving from fruit growers and from his board of supervisors.

HORTICULTURAL MEETING.

The Los Angeles County Horticultural Society met at the Chamber of Commerce, Los Angeles, last Thursday evening and was addressed by County Commissioner E. O. Essig of Ventura County on Pests Affecting the Fruit Trees and Best Methods of Handling. Following the address a number of questions were asked, some of them by members of the Los Angeles County Commission. Some feeling was shown in the passing back and forth of charges, especially with reference to trees which had been passed by the commission of one county and inspected in the other. Later direct charges were brought against the Los Angeles Commission through letters introduced and read by the secretary, and it was said that other charges were in hand. The principal complaint so far as noted at the meeting related to the matter of overcharge where work of abating nuisances had been attempted by county direction. One of the attendants charged that the inspector who went over his trees did not know a scale from a flyspeck, and the particular tree in question was sprayed to the injury of the tree but not to the eradication of the flyspecks.

$90,000 Daily

Now Spent for No-Rim-Cut Tires

Over 600,000 already sold—enough to equip 150,000 cars. All because they cut tire bills in two.

The sale of Goodyear tires has multiplied six times over in the past two years. Last year they jumped to $8,500,000. They are now running double last year.

Sixty-four leading motor car makers have contracted with us for these tires. To supply them and tire dealers we are running our factories twenty-four hours per day.

The reason lies in a patented tire—the No-Rim-Cut tire—10 per cent oversize. Men have found that this tire saves one-half on their tire bills. And the tire has become the sensation of motordom.

The No-Rim-Cut Tire

Here is the Goodyear No-Rim-Cut tire as it fits any standard rim. When you adopt this tire you simply reverse the removable rim flanges so they curve outward. They curve inward with old-style tires. This change can be made in ten seconds.

The rounded edge of the flange then comes next to the tire, and rim-cutting is made impossible.

No Hooks on This Tire

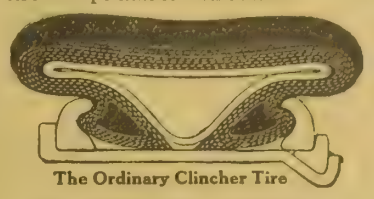
The ordinary tire—the clincher tire—has hooks on the base to hook into the rim flange. That is how the tire is held on. See the next picture.

When you use this type the removable rim flanges are set to curve inward. Note how they dig in when the tire is deflated. That is why the common tire will rim-cut if you run it flat.

Ordinary Clincher Tire

The No-Rim-Cut tire has no hooks on the base. It is held to the rim by flat tape, made of 126 braided wires, vulcanized into the tire base. These make the tire base unstretchable.

The tire can't come off because the base can't stretch. Nothing can force it over the rim. But, when you unlock and remove the rim flange, the tire comes off like any quick-detachable tire except that it won't stick.



The Ordinary Clincher Tire

This braided wire feature is controlled by our patents. And there is no other way known to make a safe tire which will stay on without hooks.

10% Oversize

These No-Rim-Cut tires, where the rim flanges flare outward, can be made 10 per cent over the rated size and still fit the rim. And we give you that oversize without extra cost.

That means 10 per cent more air—10 per cent greater carrying capacity. And that, with the average car, means 25 per cent more mileage per tire.

These two features together—No-Rim-Cut and oversize—will double the service one gets from a tire under average conditions. Yet Goodyear No-Rim-Cut tires cost no more than other standard tires.

GOODYEAR
No-Rim-Cut Tires

Our latest Tire Book, based on twelve years spent in tire making, contains many facts which motorists should know. Please ask us to mail it to you.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

MILK AS A FOOD STUFF.

We have in our library a book with the title, "The Work of the Digestive Glands." It is a reprint, in translation, of nine lectures by the eminent Russian physiologist, Professor J. P. Pawlow. It recites the results of fifteen years of experimentation carried forward in the most patient and scientific manner by Professor Pawlow and his able assistants in the laboratory of the Institute for Experimental Medicine at St. Petersburg, and has been accepted by physiological investigators all the world over as the most informing and accurate work in regard to digestion hitherto accomplished.

Following will be found the professor's discussion on the peculiar position of milk among foodstuffs:

Amongst all the articles of human food milk takes a special position, and this is unanimously recognized, both in daily experience and in the practice of medicine. By everybody milk is considered a light food, and is given in cases of weak digestion as well as in a whole series of severe illnesses, for example, in heart and kidney affections. The extreme importance of this substance, a food prepared by nature itself, we can now well understand. There are three properties of milk which secure it an exceptional position. As we already know, in comparison with nitrogenous equivalents of other foods, the weakest gastric juice and the smallest quantity of pancreatic fluid are poured out on milk, consequently the secretory activity requisite for its assimilation is much less than with any other foodstuffs. In addition, milk possesses a further important property. Thus, when it is introduced unobserved into the stomach of an animal it causes a secretion both in the stomach and also one from the pancreas, consequently it appears to be an independent chemical excitant of the digestive canal, and in this action it is remarkable that we perceive no essential difference in the effect when the milk is brought unnoticed into the stomach from that which occurs when it is given to the animal to lap.

Although flesh is a better chemical excitant, it is by no means a matter of indifference how it gets into the stomach. It must therefore be accepted that milk excites not only a really effective, but at the same time a very economic secretion, and also that the appetite is unable to stimulate this secretion into a more active or abundant flow. The secret of the relation of milk to the secretion of the digestive juices can, unfortunately, at present be submitted to no further analysis or investigation. We are at liberty, however, to suppose that the fat on the one hand is of importance for the inhibition of the gastric glands, and the alkalinity on the other for the restraint of the pancreas. Thus the gastric glands and the pancreas, notwithstanding the presence of excitants, are maintained by milk at a certain but not too high degree of activity, a matter which is in every way desirable in consideration of the easy digestibility of its constituents.

Finally, the third characteristic which is observed to belong to milk, and which is probably only an expression of the first, consists in the following: When one administers to an animal equivalent quantities of nitrogen, in the one case as milk, in the other as bread, and afterwards estimates the hourly output of nitrogen in the urine, it results that the increase during the first seven to ten hours after the milk (compared with the excretion beforehand) amounts only from 12 per cent to 15 per cent of the nitrogen taken in, while after bread, it amounts to 50 per cent. If the hourly rate of absorption and the extent to which milk and bread are respectively used up be taken into consideration, it has to be admitted that these augmentations of urinary nitrogen which appear soon after feeding, must be expressions of the functional activity of the digestive canal itself, and that this activity in the case of bread is three or four times greater than in the case of milk; consequently, in the case of milk, a much larger fraction of its nitrogen is free to be used up by the organism at large (irrespective of the organs of digestion) than in that of any other kinds of food.

In other words, the price which the organism pays for the nitrogen of milk, in the form of work on the part of its digestive apparatus, is much less than that of other foods.

How admirably, therefore, the food prepared by nature distinguishes itself when compared with all others!—Hoard's Dairyman.

NATIONAL DAIRY SHOW.

The Sixth Annual National Dairy Show to be held at the International Live Stock Amphitheater, Chicago, October 26 to November 4th, is expected to be the greatest educational and most comprehensive of any exhibition of this class of the Dairy Industry and all its allied interests previously undertaken. Not since the Columbian Exposition at Chicago and the great World's Fair at St. Louis, is it expected there will be such a congregation of conventions, dairy cattle, dairy products, dairy machinery, cold storage and refrigeration apparatus and the manufactured product of their allied commercial accessories.

The National Dairy Cattle Breeders' Associations with their membership of many thousands throughout the United States and Canada, recognizing this great annual exposition as the premier event of the year, have not only increased their appropriations, but are arranging to hold special conventions of their respective breeds during the exposition at Chicago, which will be attended by the most noted representatives in the broad field of dairy husbandry.

Fifteen thousand dollars will be offered in cash prizes for dairy cattle. Special premiums will be awarded in the milk, cream and butter tests. Scholarships in the National Student Judging contest will be given by several agricultural colleges, pure breed dairy cattle clubs, butter manufacturers and individuals. Preparations through special committees of the cattle clubs are being made to assist in bringing out not only a great show, in numbers of their respective breeds, but are planning to exhibit many of the most celebrated animals of the breed.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Back Injured.

A mare hitched to a hay wagon was struck by one of the heavy poles falling across her back. She seemed all right and worked one and a half days after the accident, then became stiff in the back and lost control of the hind legs. She has been down two days. She eats, drinks, urinates, and bowels act as usual. What can we do for her?—Subscriber, Princeton.

Displacement of fractured bones of the spinal column is sometimes deferred many hours or days—this may be a broken back. The fact that the bowels act indicate that paralysis is not complete, therefore I would advise you to nurse the animal a few days to see the results. Apply blankets soaked in warm water or heated dry and cover with heavy blankets to conserve the heat. Help the mare to her feet and support her in slings if the limbs are not completely paralyzed.—F. G. M.

Garget.

A cow six years old and a heavy milker at periods of about three or four weeks has fever in the udder, followed by clots in the milk. She experiences some pain while the clots are being forced out in the act of milking. What is the trouble?—C. X. A., Oroville.

Give the cow one pound of Epsom salts in water as a drench and follow with hyposulphide of soda, one tablespoonful in the feed, three times a day. Systematic hand rubbing with a little Iodine Petrogen applied during manipulations will aid in absorption of any diseased glandular tissue.—F. G. M.

Cough and Catarrh.

A mare, 12 years old, has coughed some for the past year. After drinking she coughs very hard. She has a discharge from the nose and, I think, through the mouth. Sometimes when she puts her head down both nostrils discharge freely.—Subscriber, Lompoc.

Evidently your mare has a collection in the cavities of the head from chronic catarrh. Cavities existing between the eyes and under the eyes may become diseased and fill with matter which often starts flowing when the head is lowered. Have your druggist prepare a powder containing nux vomica 3 ounces, belladonna 2 ounces, potassium iodide 2 ounces, sugar 8 ounces, and give one tablespoonful in the feed twice daily. Also give one tablespoonful of Fowler's solution in the feed with each dose of the powders. Some cases require surgical treatment.—F. G. M.

Slimy or Ropy Milk.

A cow 12 years old, in good condition, and having a calf four months old, yields milk which is apparently good, but when mixed with water, while washing the pails it makes the water thick and slippery. Should we use the milk?—Subscriber, Heber.

Look to the water supply for the source of this trouble. Mix some of the milk with water which has been boiled and cooled, and in all probability the slippery condition will not appear. Then mix a sample of the same milk with water which has not been boiled—a slimy consistency will indicate contamination of the water supply. Certain microbes which grow in water have a slimy coating around their bodies, and when water containing these microbes is mixed with milk the mixture thickens and becomes ropy—and this explains the mystery.—F. G. M.

Lameness—Swollen Eye.

A mare four years old and in the best of condition, became lame in one hind leg. A horse shoer examined the foot and claimed to have found a gravel and said it would come out next to the hair. Now it is in the other hind foot and one front foot. One eye and the side of the lips swell at times. This mare has not been worked.—J. R., Ione.

If this mare has not been shod and therefore has had no opportunity for nails driven too deeply to be the cause of the trouble, cracks must be forming at the juncture of the sole and wall. Matter forming in abscesses around the edge of the foot forces its way out at the hair if neglected. When such abscesses are located, they should be opened by cutting into the horn between the sole and the wall and thus allow free drainage from the bottom. Inject hydrogen peroxide into the cavity to remove the matter and pack the opening with cotton saturated with five per cent carbolic acid solution. Remove the dressing and repeat the treatment once daily.

Bathe the swollen eye and lips with warm water containing one tablespoonful of baking soda dissolved in each gallon.—F. G. M.

Splints.

Kindly advise treatment for splints in horses.—D. H. L.

Mix a half ounce of spirits of camphor and a half ounce of tincture of aconite, and in this mixture dissolve two drachms of bichloride of mercury. Apply with a feather and rub sharply with a cork. Repeat in three or four weeks if necessary. Splints may be removed from horses four years old or under, but in mature horses they may never disappear.—F. G. M.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

Costal Fistula.

A mare has a lump as large as a quart measure on the breast between the front legs. Matter flows from the tumor at times. At the time the lump appeared, seven months ago, the mare was slightly lame from contracted hoofs, but is now too lame to be worked.—M. C. C., Riverdale.

Tumors as described, occasionally appear between the front legs as a result of injury to the sternum or breast-bone, but such tumors are not often accompanied by marked lameness. Doubtless because of disease of the feet the animal has fallen and injured its breast, and, it is also probable that the increased lameness is due to an aggravation of the disease in the feet. A surgical operation is required to remove the tumors, but if not properly treated after the operation the growth returns.—F. G. M.

10" well showing artesian flow. (Exact reproduction of photograph)

KERN MEADOWS
Land and Water Company

Has 10,000 Acres of Farm Land to Rent

In tracts of any size at $5.00 and $6.00 per acre or ¼ share

WATER FREE

No tract in the West is better supplied with water. It all comes from artesian wells which flow 100 miner inches and more each.

THE LAND

is level and equal to the best for grain, hay, alfalfa, vegetables, general farm crops, cotton and rice. Is located 6-12 miles west of Santa Fe R. R. in Kern Co., the nearest shipping points being Wasco and Elmo.

One acre produced 15 tons of onions, which brought $900.00

MARKET

There is a good market for all hay and dairy products on the ground and in the Devil's Den, Lost Hill, McKilbuck, Midway and Sunset Oil Fields, which lie west and southwest from Kern Meadows. Cream brings the highest market prices, collected at the dairy and creamery. Company pays express charges from Wasco. Shippers facilities are complete for delivery by rail.

A Farmer can make Money on this Land

Preference of employment on the companys improvement work will be given residents on the land

MAKE YOUR DOLLAR MAKE A DOLLAR

An interest in this land can be obtained for a limited time on a basis of $50.00 per acre, by buying Treasury Stock of the Company at par. Incorporated under the laws of California for $500,000.00, shares of a par value of $1.00 each. Money received from sale of Stock to go into improvements. Subscriptions received at main office of Company. None of the land will be sold for less than $100.00 per acre. The price of the stock will soon be advanced. Subscription taken for 50 shares, with payments of $10.00 down and $1.25 per month, or any multiple of 50 shares, as 100, 150, 200, 1000, etc., with payments in proportion. This is the chance to place your money where it will earn a big profit for you. You buy at $50.00, the land will not be sold for less than $100.00. Write for particulars. Address

The Ornamental Garden

HOW TO DESTROY PLANT LICE.

By C. P. Gillette.

This is the time of year when rose bushes, golden glows, boxelders, cherry trees and other plants are likely to be infested with lice that sap their vitality, and make them unthrifty. These lice are rather easily controlled with simple spray materials.

As these insects all get their living by sucking the sap of the plants upon which they live, it is useless to attempt to kill them by the use of poison, such as Paris green or arsenate of lead put upon the surface of the plants. They must be destroyed by the application of a substance that will kill by coming in contact with the exterior of their bodies. Among the most useful substances for this purpose are: kerosene emulsion that is about 7 per cent oil when applied; tobacco decoction made by steeping, a little below the boiling point, one pound of tobacco to each four gallons of water; or one pound of soap (preferably whale oil) to 8 gallons of water. Where it can be obtained, Black Leaf Extract, 1 part in 70 parts of water, or "Black Leaf 40" in the proportion of 1 part in 700 of water, is a very effectual spray for all plant lice.

A GOOD LAWN.

There is nothing that adds to the beauty of the home, more than a good blue-grass lawn. The most essential thing is to get the ground well leveled off before seeding; for it will never become level after seeded down. The leveling is best done with a length of railroad iron; drawing it back and forth until all the low spots are filled and the rail touches the ground along its whole length. If you cannot get a railroad rail, a timber will do the work. In seeding, use at the rate of one bushel of blue grass seed to the acre; but it takes two years to get a good sod of blue grass alone. To keep the lawn in good growing condition, it should have a good coat of fertilizer applied in the fall; not disfiguring your lawn with a lot of coarse stable manure, but using fine rotted manure, or still better, pulverized sheep-manure at the rate of 500 lbs. to the acre. After sowing the seed, do not rake in but cover all over with one inch of well-rotted manure. That will not bake and become crusted, in case of hard rains, as the dirt would. The young plants will come up readily through the covering, and it will insure a good stand and a fine lawn.—A. Brackett, Excelsior, Minn.

STALK-BORERS IN FLOWER GARDENS.

These are the worms which make holes in the stems of lilies, dahlias, golden glow, peonies, etc., causing the stalks to fall over. They come originally from weeds, and the eggs are laid at the base of certain weed-stalks in the fall, and hatch the following spring. A garden adjoining a weedy, neglected lot is apt to be troubled.

Sticky tanglefoot of medium thickness, which can be bought easily in large quantities, applied over a space of three inches wide on the outside of the baseboard of a fence, or a board barrier placed for the purpose, we have found to be an effective preventive, since the worms cannot cross the sticky band. This should be done early in June, and might call for more than one application, in order to keep the barrier sticky.—F. L. Washburn, Division of Entomology, Minnesota University Farm.

RURAL OUT-OF-DOOR ADORNMENT

(Continued from Page 27.)

shrubs. Imagine such a roadway in the interior valley of California. We had a sample of such outside the city of Fresno till ignorance under supervisorial management came in and trimmed and mutilated. The Kerney avenue outside of Fresno is really world-renowned. Palms, eucalyptus, and oleanders and pampas grass formed the parking which was planted symmetrically. I have seen no more beautiful roadside planting anywhere in the world. It could be imitated most profitably. A much neglected tree for avenue planting in California is the Arabian carob. It is evergreen, of great spreading form, and in time grows to magnificent size and stately proportions. It is besides, the producer of the well-known St. John's bread, long, sweet nourishing pods, good for man and beast, of tremendous food value in its native countries of the Orient. When established it will get along with little care, though of course it is much benefited if well watered.

I love to imagine our western country with its highways bordered by large, stately trees, its rapidly increasing farm homes surrounded by fruitful fields and set among trees and flowers. I like to imagine some of our old groves saved, our river banks beautified instead of plundered, our school grounds inviting and full of interest instead of naked, crude and meaningless. I like to dream of our highways well kept, our mild winters, our rainless summer. What a playground for all the rest of our country! Such adornments would pay their costs of construction and maintenance a thousand times over. It would draw to us the best people of the land, it would bring us fame and money; it would bring us culture; it would raise among us an art production and art expression that would stand high before the whole world. It would make us happier not alone through the beauty we ourselves would absorb, but also through the beauty we with pride of our land could share with others. It is not an unimportant question this of rural out-of-door adornment. Nor is it an impractical one. It is not an undertaking that will rob one to give to another. It means a universal blessing; it means as much to the city as to the country. Today with our rapid means of highway travel the highway is traveled more than ever, more of the country is seen than ever, more intimacy is established between distant places and neighbors. It is but a matter of a civilized system and a not-burdensome expenditure of money to make such highway traveling instead of burdensome and tiresome, one of the greatest enjoyments of life. And you who are nurserymen should stand in the front rank of those who urge and work for all this. For you are ethically and commercially interested, and it should not be forgotten that beauty craves more beauty, and you are the forebringers of these millions of plant children, many of whom shall grow into greater and greater beauty and tell future generations that men and women of today had souls.

The grain warehouses at Perris, Riverside County, are rapidly filling.

General Agriculture

PREPARATION OF THE SEED BED.

Kindly forget for the moment all that you ever knew or thought or believed as to the way of preparing a seed bed, and think for a little bit as to how the young plant grows. When the seed is planted, has taken up a sufficient amount of moisture, and has the proper temperature, it puts out a sprout, which pushes out into the earth and becomes a root; and from this branch off rootlets, and from these what are called root hairs, which are simply elongated cells.

Soil Soup.

The plant takes its food always in liquid form. It lives on "soil soup," which it absorbs through these root hairs and sends it onward through rootlet and root into the sprout out of which nature is making a stalk. This sprout comes up sharp pointed in the grasses and grains, and as soon as it reaches the sunlight becomes green in color, finally unfolding its leaves. Its growth is dependent on the sunlight, on contact with the air, and on the amount of nourishment it receives from the root through the rootlets and root hairs. This nourishment it receives, not from the water, but from the soil soup. It can make no use of the water that stands between the soil grains, but only of that which covers each particular soil grain in a very minute film, about half as thick as the film of a soap bubble.

So you see that if this little plant of ours is to thrive, it must be able to get its root hairs close to the soil grain—must be able to push its root forward farther and farther into the soil. This root has a point made up of hard cells which the plant pushes through the soil by putting new cells behind it and driving it just as you would drive a stick into the ground.

Drainage.

Therefore your seed bed must be well drained naturally or artificially, so as to get rid of the water that the plant can not use, and which would strangle it to death by excluding the air. It must be sufficiently loose to enable the plant to push its roots on through the soil. It must be sufficiently compacted, so that the root hairs can come in contact with as many particles or soil grains as possible. It must not have great vacant spaces on account of lumps so hard that neither the roots nor the rootlets can penetrate, which are of no possible use, but do great damage by admitting too much air into the soil, which the rootlets must avoid and find proper soil conditions elsewhere.

While the plant can make no use of standing water, it must have moisture in these films around the soil grains. A few warm days would exhaust the water in the turned furrow, the soil as distinct from the undersoil; and if it does not rain, it must get water from down below, where there is always water in any soil fit to cultivate. Hence in preparing this seed bed you must have close connection between the turned furrow and the undersoil. In fact, you want to have that about as compact as you can make it with moist earth. If you have these conditions, the plant can not help but grow, and its size will be determined by the fertility of the soil, which may be considered as quite distinct from its physical condition. It is the physical condition we are talking about now.

Preparation.

How, then, are you to prepare this seed bed? If you are putting corn on sod, then you should have plowed it last fall for various reasons; to disturb the worms which are found in all old sods; to get the effect of the winter's frost in weakening the grass roots and hastening their decomposition; to save time in the spring, when time is more valuable. But if you have not done so, you want to plow it now, and then when plowed work it down as thoroughly as possible with disc and harrow and sometimes with roller, in order to get the turned furrow in as close connection as possible with the undersoil.

Prevent Clods.

If you do not disk it, a crust will form and cracks will appear, the moisture will escape, and the land, if it has any great amount of clay in it will work up lumpy and you will have trouble with clods. Form a mulch of dry dirt. This will hold the moisture till you are ready, and when you plow it up you will not have any clods, especially if your harrow immediately follows the plow, or if you harrow all you have plowed that forenoon before you unhitch for dinner.

But, you say, I am not going to put it in corn, but in oats, spring wheat or barley. Very well, disk it anyway. Your oats and wheat will each require more moisture than corn, and the oats more than wheat. Therefore, conserve your moisture and get rid of the lumps—which, as above explained, are dead matter and no better than a stone for the season in that field, and do as much damage by letting in air as the stone would. The idea in preparing a seed bed is to conserve moisture, prevent clod formation, get the land so that the plants can make use of every spoonful you plow up, and in such shape that it can borrow from below to meet their requirements.

There are comparatively few things about agriculture that are absolutely known, and few methods that can be prescribed that can be followed implicitly, but this is one of them; namely, keep off your land when it is wet. You had better be testing your seed corn, or applying formalin to seed oats or wheat, than fooling away in the cornfield in wet weather. If you have nothing else to do, it might be a good thing to get out your road drag and work the road, or you might do some of the things your wife has been asking you to do for a month past, and you have said you had not the time.—Exchange.

TOADS IN THE GARDEN.

One of the best friends of the gardener is the toad. The toads destroy myriads of destructive insects; in fact 98 per cent of what toads feed on is made up of bugs, worms, insects, etc. English gardeners pay as high as $25 per hundred for toads, which they colonize in the gardens. Toads live for several years and cling to their feeding grounds. Instead of harming toads, protect them, and if necessary, provide breeding pools for them. In the garden make shallow holes in the ground and cover with stones or boards. The toads will retire into these in daytime and come out at dusk and start in on the bugs and insects.

Fertilize With Air

The nodules on these roots are colonies of bacteria that suck the nitrogen from the air and store it in the plant, which then becomes a valuable fertilizer. The bacteria were placed there by inoculating the seed with

FARMOGERM

(High Bred Nitrogen Gathering Bacteria)

Science has thus brought the wonderful possibilities of bacteria fertilization to a thoroughly practical and simple method of application.

This places within reach of every grower an enormous increase in the tonnage and fertilizing value of

COVER CROPS

Vetch, clover, fenugreek and all legumes can be inoculated with Farmogerm at a nominal expense and by a simple operation, or we will treat the seed for our customers if preferred.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

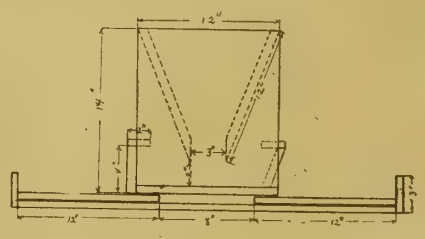
DRY FEED HOPPER WITH PLATFORM.

By J. E. Whistler.

The important points of this hopper are the throat, which must be at least three inches wide to prevent banking of the food, the slant of the sides, which must be as given or more vertical for the same reason, and the platform which catches the small amount thrown out, and which the poultry always prefer to eat rather than take it from the hopper.

If kept full the wind will not affect

DRY FEED HOPPER WITH PLATFORM



it, except when blowing very hard. Where it is marked "8 inches" the board in the platform may be omitted. Make the platform a little longer than the box. The three inch strip across the end of the platform is not shown, in order to simplify the drawing. If the four inch strip is slanted in as shown on one side, the box will be cleaned out somewhat better. No lid is shown. If indoors, a board is enough. If made six feet long it will hold a sack of feed.

POULTRY FEEDING.

Laying hens should be fed regularly and made as comfortable as possible, in other words make them feel at home. Keep everything neat and clean about the plant and yards. Clean windows and plenty of fresh air and sunshine is a necessity for heavy winter egg production, and the general welfare of the fowls.

To show the importance of water in poultry keeping and feeding the percentage is given below: An egg is composed of 65 per cent of water. The hen's body including feathers and bone is composed of 55 per cent of water. So fifty hens will need 4 to 6 pints of water daily.

Feed enough without giving them too much causing a waste and making them lazy. Make them work for every particle of grain food they get. At least once a day a hen should have an empty crop. The correct ration for laying hens is about two-thirds grain and one-third dry mash. The grain foods, fed morning and night should be scattered in deep litter. The dry mash should be fed out of hoppers always before them.

Green food must also be supplied in order to have the hens do well. Mangolds, cabbage, clover and alfalfa are the best green feeds. Twenty-five fowls should receive about four pounds of green food daily.

Increase in food consumption increases weight, and this in turn increases egg production. The old theory and easy way of answering the question, why hens do not lay, answering that they were too fat, is no longer believed by men who have made the keeping of hens a study. A poor hen never lays. A hen first has to have surplus fat to make the yolk, next the white and last the egg shell before she can lay. The yolk is composed mostly of fat, and is the first part of an egg formed, so it necessarily follows that she must have surplus fat, more than she needs to keep up her body heat and condition, before she can lay.

A good dry mash ration for laying hens to be kept in hoppers, is as follows: Mix 10 pounds corn meal, 10 pounds wheat middlings, 5 pounds bran, 3 pounds oilmeal and 5 pounds beef scraps.

A good grain ration is equal parts of corn and wheat.

The following is a good fattening ration: Mix 10 pounds wheat bran, 20 pounds corn meal, and 3 pounds beef scraps, mixed with sour butter milk, fed morning and evening all they will eat up clean, not more.

Egg shells contain 94 per cent carbonate of lime and 7 dozen eggs contain 1 lb. of lime. This shows that it is necessary to supply laying hens with plenty of lime forming material like oyster shells.

But if you do not feed them with the one important factor, with which they can grind their feed and manufacture it into eggs, all your labor, time and feed is wasted. That one all important factor is "grit," good, hard and sharp grit.

The following goes to show the importance of green food, in feeding poultry. In an experiment at the West Virginia Experiment Station it was found that 100 hens 1 year old consumed in 1 year 58 pounds of grain food and all the green food they wanted to eat each and produced in the same time 11,452 eggs; while another flock of 100 hens 1 year old and fed no green food, consumed each 61 pounds of grain food and laid only 9,039 eggs or 2,413 eggs less than the green food fed fowls and had more grain.

Here is what 25 well-fed White Plymouth Rock pullets were fed laying at the same time, which was first week in January, 84 good sized eggs.

Time—One week. Cracked corn, 10 pounds; whole wheat, 10 pounds. This was fed in litter. Corn meal, 4.36 pounds; wheat bran, 2.18 pounds; wheat middlings, 4.36 pounds; oil meal, .68 pounds; beef scraps, 3.63 pounds; green cut bone, 3.2 pounds; mangolds, 32.7 pounds. The dry mash was fed in hoppers always before them. The mangolds were sliced and thrown on the litter. Oyster shells, 1.30 pounds; grit, 3.10 pounds. Oyster shells and grit were also fed in self-feeding hoppers always before them.

During the same time they produced 41.6 pounds of droppings during the night, being scraped off the drop boards each morning.

Eggs at that time sold for 35 cents a dozen.

The droppings are easily worth 20 cents a hundred pounds and at a good many places sell for 40 cents a 100 pounds. Figure out the profit. Please note the time of year, when as a rule, results are not of the very best.—Wis. Agriculturist.

You poultrymen put your hens on the right foundation when you use Lee's Lice Killer. There are other lice killers, but only one LEE'S—remember that. One of the best endorsements of

LEE'S LICE KILLER

is the fact that dozens have tried to imitate it—and *you know no one would attempt to imitate an inferior article.* Lee's Lice Killer kills by vapor and contact. It is quick and sure fatality to lice, and just as certain to keep the hens healthy. It is the ONE safe, sure and economical way to stop lice damage. Always ready, easy to use. 35c, 60c, $1.

GERMOZONE

Has Been Saving **CHICKS** For 14 Years

It was the result of Mr. Lee losing one-half his chicks in 1896. He was driven to do something and do it quickly. He spent more than a hundred dollars to get it for his own use. The idea of putting it on the market came from his neighbors' volunteer purchases. As a remedy for Bowel Complaint in chicks it stands alone as a result producer, is not injurious, removes both the disease and cause, leaving no bad after effects.

Germozone is a germicide—bowel regulator—system builder. Endorsed by poultry-raisers from coast to coast. Price, 50cents. Buy it from your dealer in either liquid or tablet form. Or direct from us postpaid, if your dealer cannot supply.

Everything for poultrymen that is worth buying and using. Write for descriptive printed matter, and a free copy of Lee's "Chicken Talk" by Geo. H. Lee, himself.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

GAPES HAVE NO TERRORS.

If the chicks develop gapes, use plenty of a very dusty quality of air-slaked lime in the coops and brooders. I have entirely cured this disease by promptly putting into each brooder, right under the hover and where the chicks must sleep on it for a night or two, a thick layer of very dusty lime. Since learning the proper way to treat it, this trouble has no terror for me.

Be sure to provide plenty of air when you try this, and if the air seems exceedingly dusty, don't leave the chicks in it more than an hour or two. If they have to be removed for the remainder of the night, place them back on it for another treatment the next night, and you will neither see nor hear of any gapes from that brood.

The constant shuffling about of so many little feet causes a suffocating dust to arise. They inhale this, and as it causes the gapeworms in the trachea to be sneezed up, the worms fall into the lime and die.

The generous use of lime about the coop and brooders prevents both lice and gapes.

I have laboriously extracted gapeworms from each individual by hand, with many fatalities and some cures, but am satisfied that lime, used in time and as described, is a much simpler and more effective remedy.—Farm and Fireside.

IMPROVISED BROODER.

There were fifteen more chickens than the brooders would accommodate, and there was no mother hen to care for them. We did not wish to get another brooder, so improvised one in this manner:

We placed one box within another slightly larger one, and filled the intervening space with sawdust. A well-fitting door with a large pane of glass was placed over the open side. This box was set in a dry, secluded place and a small scratching park made in front of it.

Within this brooder was placed yet another box only a little larger than was necessary to hold the chickens; this was the hover. A piece of warm flannel was tacked across the upper side so that it hung down against the little bodies, and a small flat jug full of hot water was placed in it every morning and evening. After placing the chickens in this for a few times they learned to go there for themselves. This box being small retained the heat of their bodies, and with the aid of the jug kept them comfortable through some severe early weather.—Successful Farming.

WHY THE CUCKOO BUILDS NO NEST.

A Danish legend about the cuckoo is very curious. It relates that when in the early spring time its voice is first heard in the woods every village girl kisses her hand and asks the question: "Cuckoo, cuckoo, when shall I be married?" And the old people, borne down with age and rheumatism, ask: "Cuckoo, cuckoo, when shall I be released from this world's cares?" The bird in reply continues to sing: "Cuckoo!" And as many times as he sings they count one year to the fulfillment of their desires.

It is said that the poor bird has so many questions put to her that before she realizes it the building season has gone by and she is forced to put her eggs into the hedge sparrow's nest.—London Globe.

The poultry mans' worst enemy is lice, and the greatest torment to the poultry.

WAKE UP!

You are certainly alive to the fact that the cost of living is materially higher at this time than it was a few years ago.

Has your income increased in proportion to your cost of living?

We hope that it has, but we know that in the majority of cases it has not.

Do you know that the groceries you buy from the retail merchant passes through an average of five different hands before they reach you? Each one of these hands or firms has to have its profit.

Our system of modern merchandising eliminates much of this unnecessary expense, and enables us to place the every-day necessities of life in the hands of the consumer at a saving of 20, 25 and in many instances as high as 50 per cent after you have paid the freight.

Suppose your grocery bill is only $20.00 per month or $240.00 per year, and suppose you save only the minimum, 20 per cent, by buying from us—it would amount to $48.00. Can you make money any easier? Will your dollar earn or buy more elsewhere?

We want to know what you are paying your local dealer for the staple articles listed below. Prices vary in different localities, and we would ask you to make a comparison for your own information as well as ours.

Enter in pencil the prices you pay, opposite our prices—cut this slip out and mail to us and we will send you a

Useful Prize

for your trouble. If you send us a ten dollar order with this slip we will give you credit for $1.00. This offer is limited to one order from a family.

CONTENTS THIS WEEK

THE PACIFIC FROM LOMALAND, Cover.
RURAL OUT-OF-DOOR ADORNMENT, 27.
CITRUS AND TROPICAL FRUITS.—Feijoa, a Commercial Possibility; Seedling Avocados; Annual Picnic; 28, 29.
DECIDUOUS FRUIT CULTURE.—Pedigreed Fruits; Ventura County Convention; Horticultural Meeting; 30, 31.
LIVE STOCK AND DAIRY.—Milk as a Food Stuff; National Dairy Show; 32.
VETERINARY.—Back Injured; Garget; Cough and Catarrh; Slimy or Ropy Milk; Lameness; Swollen Eye; Splints; Costal Fistula; 33.
ORNAMENTAL GARDEN.—Plant Lice; Good Lawn; Stalk Borers; 34.
GENERAL AGRICULTURE.—Preparation of the Seed Bed; Toads in the Garden; 35.
PROFIT IN THE POULTRY YARD.—Dry Feed Hopper with Platform; Poultry Feeding; Gapes Have No Terrors; Improvised Brooder; Cuckoo Builds No Nest; 38, 39.
EDITORIAL.—Fundamentals of Agriculture; Farm Friends and Foes; Exports of Farm Products; California Fruit in England; Farmers' National Congress; Editorial Notes; 40.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 41.
QUESTIONS AND ANSWERS.—Tanning Leather; Leaf Fungus; Grafting Walnuts; Indigestion; Russian Thistle; Liver Trouble; Wild Sweet Pea; Palo Verde Seed; Ants in the House; Measuring Hay in the Stack; Making Soil Mellow; Walnut Information; 42, 43.
HOUSEHOLD.—Ballad of Buttermilk; The Horseradish Patch; 44, 45.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 46, 47.

The Rand, McNally Co. of Chicago, New York and Los Angeles, has just issued a new pocket map and shippers' guide of California. The map is strictly up-to-date and shows all the railroads, postoffices, lakes, rivers, etc. Its most valuable feature is the index of every town and county, river, and even creek in the state. Even the islands are indexed with marks to show where to find them on the map. The price is 25 cents.

FUNDAMENTALS OF AGRICULTURE.

Fundamentals of Agriculture, edited by James Edward Halligan, chemist in charge, Louisiana State Experiment Station, and published by D. C. Heath & Co., Boston, while primarily intended as a text book in schools giving attention to agriculture, is of great interest to all who would be posted as to the general fundamentals of agricultural science. A great many authors have joined in the production of the book, Prof. Halligan editing and bringing together articles written by specialists along various lines from all sections of the country. The idea of this diverse authorship is to furnish the pupils the best information on each line that can be obtained. At the end of each chapter is a list of bulletins and reference books touching more fully upon the subject of that particular chapter. To make the study of fullest value, it is suggested that field experiments be conducted in conjunction with the reading.

The chapter devoted to the soil is written by Prof. Whitson of the University of Wisconsin and treats of the relation of soil to plant growth, soil fertility, soil physics, and water requirements of crops. Chapter Two on plant life is written by Prof. Bessey, Department of Botany, Michigan State Agricultural College. The department on manures and fertilizing is written by the editor, Prof. Halligan, and consists of five parts. The farm crops chapter is divided into fourteen sections, each section being handled by a different writer touching upon diversification, corn, cotton, rice, wheat, oats, rye, barley, root crops, forage crops, and several others, including weeds. The chapter on trees and the garden is divided into six parts with as many others which have to do with plant diseases, insects, birds, live stock, dairying, feeds and feeding, and miscellaneous. The complete index, together with many illustrations, make it a most valuable addition to the library.

FARM FRIENDS AND FOES.

A text book of agricultural science of interest to all dealing with agriculture is Farm Friends and Farm Foes by Clarence M. Weed, D.Sc., State Normal School, Lowell, Mass. The book is published by D. C. Heath & Co., Boston and Chicago, at 90 cents, which is a remarkably low price for so valuable a book.

The volume is divided into five parts, the first dealing with foes among the weeds, the next with foes among the insects, the third with friends and foes in the fungi, the fourth with friends and foes among the birds, and the last with friends and foes among the mammals. The text of nearly 340 pages is fully illustrated and has a complete index.

The book is planned for use in schools, but is good reading for everyone connected with agriculture. At the end of each chapter are suggestions for observations by pupils. The older ones will find it of value. Where there are youngsters in the family we believe it will be read or even studied with the greatest interest.

EXPORTS OF FARM PRODUCTS.

Exports of farm products will aggregate a billion dollars in the fiscal year which ends with the month of June. The government's fiscal year has for many years ended at the middle of the calendar year, the purpose being to give opportunity to classify and arrange the year's figures in time for consideration by the Congress whose regular date of meeting is the first Monday in December, thus the Bureau of Statistics of the Department of Commerce and Labor presents its detailed yearly report of commerce for the year ending June 30th. Figures for eleven of the twelve months of the fiscal year 1911 are now available, and show exports of cotton 574 million dollars, foodstuffs 354 million dollars, and tobacco 35 million, a total for the eleven months ending with May of 963 million dollars, making it quite apparent that the sum added for the month of June will bring the total exports of farm products during the fiscal year 1911 above the billion dollar line.

CALIFORNIA FRUIT IN ENGLAND.

While in the Pajaro Valley recently we came in contact with Mr. Thos. Eastwood, buyer for the L. Connolly Co., fruit brokers and auctioneers of Liverpool. He was much pleased with the outlook in the Pajaro Valley. His firm has handled some apples from that section and proposes to handle more. The only variety grown there which his market will touch is the Newtown Pippin. Asked as to the Bellflower, he said, "We don't know anything about it and don't want it. The market demand has been for the Pippin." The Washington Navel orange is not a favorite in the English market, principally because of its high price. The smaller European orange has been generally better received; the Jaffa seedling is really the favorite. Valencias as grown in California, are also usually too high-priced. Both Navel and Valencia, however, have a limited demand with the better class of the English trade.

FARMERS NATIONAL CONGRESS.

The official proceedings of the 30th annual session of the Farmers National Congress of the United States which was held at Lincoln, Nebraska, last October, has been issued in a book of almost 200 pages. Addresses were made by Wm. J. Bryan, Dean Burnett of the University of Nebraska, Prof. Woods of the University of Minnesota, and other noted speakers. The secretary of the organization is Geo. M. Whitaker, 1404 Harvard St., Washington, D. C. The vice-president for California is Rev. R. P. Shepherd, Los Angeles.

That live and energetic body, the Los Angeles Chamber of Commerce, has just issued the first number of The Bulletin. It has to do only with matters pertaining to the Chamber and its work and admits no advertising. We note a novel departure in the publicity work of the Chamber; one member is at present touring Europe with a series of views of California and delivering lectures upon them in Esperanto.

The July Sunset Magazine, vacation number, is one of the best of that publication. The leader article is "Sunshine & Seabreeze, Inc.," and is a description written in a light vein of the various beaches surrounding Los Angeles. It is illustrated with three-color half-tones. The remainder of the magazine is given largely to fiction of a nature to be appreciated on a camping trip.

The orange groves of Butte County were visited by a hot wind last week but growers generally believe the fruit is so far advanced no harm will be done. This year's crop will be exceptionally large

A feature of the recent Nurserymens Convention, which has been regular with it for years, and which may well be imitated by the directors of other conventions, is the badge book plan of program. The members of the association are listed in the book containing program, each one having a number given consecutively according to the time of joining the association. Each member attending is given a badge and in addition a large button with his number in such plain figures that it may be read across the room. The badge book having been given to each, the strangers are soon located and acquaintance is easy and natural. In addition to this number, the name of each delegate is plainly printed on his badge.

The University of Missouri has just established a new forestry school, placing Prof. J. A. Ferguson at its head. The university has 50,000 acres in forest lands in the southern part of the state which will be used as an outdoor laboratory for experimentation.

Mr. Adams of the Spreckels Experiment Station, has given considerable attention to the eradication of morning glory. He recently showed us a small plot of a few rods of ground on which a number of hogs were kept for three years and yet there were occasional spears of the pest coming through the soil now that the hogs have been removed. Mr. Adams has found the salt remedy the best next to perfectly clean culture. He has applied salt at the rate of 2½ pounds to the square foot. This destroys the soil for perhaps a couple of years, but the rains and irrigation will ultimately remove it from the soil.

Messrs. J. & A. Churchill of London have in preparation a book on "Who's Who in Science," to be edited by Mr. H. H. Stephenson, who desires information as to scientists whose names may appear in the book. The object of gathering this data is that scientists may be able to communicate with each other the world over. The book will give a condensed summary of the achievements and careers of great men in scientific lines. The publishers may be addressed at 7 Great Marlborough St., London.

Growers of mustard in California may be interested in the recent ruling of the board of food and drug inspection of the department of agriculture that charlock must not be substituted for mustard, or if it is, the label must clearly indicate that fact. The condiment prepared from mustard or mustard flour and charlock with salt, spices, and vinegar is not prepared mustard, but provided a greater quantity of mustard than charlock is used, then it may be called "prepared mustard and charlock."

The American Land and Irrigation Exposition management which is getting ready for its great show in November sends out announcement that $1000 cups are to be given for the finest exhibits of wheat, corn, oats, cotton, potatoes, sugar beets, hops, and alfalfa. For barley a $1500 gold cup is to be presented. For apples a $500 cup will be given for the best 25-pound box of apples. These are all open to competition from any section of the world.

The University of California announces that over 1000 new specimens have been added to the University's zoological museum. During the vacation a corps of professors and student assistants will be busy gathering and mounting others.

Agricultural News Notes of the Pacific Coast

Northern California

Olives promise a full crop at Oroville, Butte County.

Colusa will attempt rice culture, expecting to plant about 75 acres.

Oroville, Butte County, is planning for a citrus fair to be held this fall.

Tule farmers of Dunnigan, Sutter County, are petitioning for a new levee district.

Woodland, Yolo County, reports general fruit crop nearly 50 per cent short of last year.

Harvesters all over the Sacramento Valley are busy with the barley and wheat harvest.

The Western Creamery Company has taken over the creameries at Meridian and Marysville.

Sheridan, Placer County, is putting down test wells hoping to locate a flow of artesian water.

Apricot dryers at Vina, Tehama County, pay 10 cents per orchard box for cutting fruit.

San Franciscans have purchased a 60,000-acre tract in Tehama County and will colonize.

Sacramento Valley apricots have commanded some exceptionally high prices at Montreal.

Over 2,000 acres of the Bidwell ranch in Butte County have been sold and will be subdivided.

Sugar beets are looking exceptionally well at Hamilton City and irrigation has already begun.

The grain harvest of the Sacramento Valley is nearing an end and yield has been satisfactory.

Apple growers of Sebastopol, Sonoma County, closed contracts for dried apples at 8 and 9 cents.

Onion fields at Walnut Grove, Sacramento County, are being attacked by thrips and immense damage is being done.

Fruit growers believe that the court of commerce has granted their appeal for reduction of the $30 icing charge to $7.50.

About 15,000 acres of land will be thrown open to colonization on the Sacramento along the line of the Central California Traction.

The state Country Life Commission has decided that "state regulation of farm land in California" shall be the principal topic of discussion at the next annual.

Mrs. Bidwell has just sold 4800 acres of the Chico ranch to a company which will subdivide. One of the features of the subdivision will be a fine tourist hotel.

A plan is outlined for the improvement of the Sacramento and San Joaquin rivers and tributaries which involves the ultimate expenditure of over thirty-three millions of dollars.

The Secretary of the Interior has approved the application of the Madeline Meadows Irrigation Co. and construction will soon be commenced on a large irrigation scheme in Lassen County.

The Vaca Valley claims that from Northern California she is shipping almost a half of all early fresh deciduous fruits. In one day's shipments from the northern part of the state, of 30 cars Vaca Valley supplied 16.

Central California

Tulare has a hen which adopted a litter of puppies.

Salinas is making preparation for its big exposition week.

Strathmore, Tulare County, will ship fifty cars of oranges this season.

A Stockton man is about to establish an unfermented grape juice factory.

Over 3000 acres of potatoes are planted around Lodi, San Joaquin County.

Some sections of Tulare County have suffered greatly because of grasshoppers.

Fresno fresh fruit shippers are reaching Chicago with a six and a half-day service.

Grain growers near Bakersfield, Kern County, are hoping for the banner yield of grain.

A grape grower at Kerman, Fresno County, has refused $37.50 per ton for his seedless grapes.

A new orange packing house is being constructed at Worth, near Porterville, Tulare County.

Dried fruit producers are holding for good prices and the buyers are slow in making offerings.

A raisin grower of Fresno County is appealing for the establishment of a special raisin growers journal.

Some raisin growers are hoping for a raisin protective league along the line of the citrus organization.

The breaking of a dam in Fresno County flooded much valuable grain land between Mendota and Los Banos.

The levee on the east side of the river near Stratton, Kings County, broke recently and flooded about 700 acres.

The horticultural commissioner of Monterey County, has notified the farmers that they must destroy all Russian thistle.

The directors of the Oakdale irrigation district in Stanislaus County have let a million dollar contract for an irrigation system.

Different sections of the Valley are appealing to the farmers to prepare for exhibits for the coming Panama-Pacific Exposition.

Selma, Fresno County, reports the appearance of a new vine pest in the form of a fungus which curls and causes the leaf to dry and fall off.

The Tulare County Dairyman's Association has organized and elected S. O. Walker of Tulare, president, and Ed Hart of Farmersville, secretary.

The new management of the Corcoran sugar factory in Kings County announces that it is probable that contracts will be made for next year's beets.

Conferences are being held by the board of supervisors of Tulare County and dairymen of that county looking toward an ordinance which it is hoped will suppress tuberculosis.

A proposed irrigation meeting at Firebaugh, Fresno County, was broken up because of summer flood of the San Joaquin River. As one paper expressed it, "The discussion of means of getting more water on land by irrigation was called off by campaign to get several square miles of water off land."

Southern California

Riversiders are making a concerted attack on English sparrows.

Redlands has shipped since November 1st, 1910, nearly 5000 cars of oranges.

Elsinore, Riverside County, is placing a two thousand acre tract on the market in small parcels.

A corporation financed by Riverside capitalists will plant a 200-acre walnut grove on Magnolia avenue.

Potato growers of Monrovia, Los Angeles County, are cleaning up handsome money at $2.75 per cental.

Southern California potato growers have greatly benefited their market by their co-operative marketing organization.

Riverside County is to supply a large number of Matilija poppies for the Panama-California Exposition at San Diego.

Shipments of cantaloupes have materially decreased in the Imperial Valley, but the total is already over the 2000 mark.

Oxnard, Ventura County, grain growers are in the midst of threshing. The yield will not be more than 50 per cent of normal.

Fillmore, Ventura County, recently had a clean-up day when its streets and roadsides of the surrounding country were given a polishing.

The women of El Centro, Imperial County, have combined and are refusing to patronize stores which do not protect their food stuffs from flies.

The receipt in the eastern market of California and Georgia melons glutted the market until rather low prices prevailed over the East for a short time last week.

A model $10,000 farm of only five acres is to be established on the Lankershim Ranch in Los Angeles County. This great ranch is being subdivided and sold off in small parcels.

The Volunteer cotton crop of Imperial Valley is already ripening and it is said picking will begin the last of this month. Some are estimating the first picking will aggregate a half bale to the acre.

Riverside County shows 17,000 acres in oranges; San Bernardino County, 40,000 acres; San Diego, 1400 acres; Los Angeles County, 30,000 acres; Orange County, 12,000 acres; Ventura County, 3000 acres.

Coachella, Riverside County, has just received two cars of Deglet Noors and Rhars dates direct from Algeria. They will be planted on 21 acres of land which will be the largest single date grove in the world outside of Algeria.

Riverside claims the greatest vineyard ever grown and the biggest orange grove in the world within an hour's ride of that city. The vineyard is that of the Italian Vineyard Co. near Cucamonga and the orange grove is that of the West Riverside Estate.

The Riverside Press says that it is receiving both brick bats and bouquets because of its recent editorial regarding the status of the orange growing situation in that oldest orange producing section of the state. The Press says that its only reason was the desire to start an inquiry as to how Riverside's citrus producing conditions may be helped.

The Coast

Wool sales at Ontario, Oregon, have ranged from 13 to 17 cents.

Lewiston, Idaho, is appealing for a station of the weather bureau.

Yuma claims it is having the finest weather in any section of the United States.

The largest wool clip in New Mexico belonging to one man is 400,000 pounds.

The shipment of cattle from Southern Arizona has practically ceased for the season.

One shipment of a thousand head of cattle passed through Yuma last week for Los Angeles.

At several wool sales made at Conrad, Montana, last week 18 cents or better was obtained.

A large acreage of sugar beets is being harvested below the American line in Mexico near Calexico.

It is estimated that the grazing lands of the Philippine Islands will accommodate 9,000,000 head of cattle.

Garfield County, Wash., with slightly over 2000 inhabitants will produce nearly $2,000,000 worth of wheat this year.

Pullman, Washington, had the heaviest rains during June ever experienced.

Grain growers at Walla Walla, Washington, estimate an average yield in that section of 30 bushels to the acre.

Colorado Springs, Colorado, has called for a convention of women farmers of the world, to be held in October.

The products of the Philippine forests aggregate in value about 6,000,000 pesos. The output is constantly increasing.

Irrigators in the Quincy district in Grant County, Washington, are experimenting with irrigating by a sprinkling apparatus.

Southern Arizona ranges are well cleaned up of cattle, and the heavy rains will soon have pastures ready for new feeders.

It is said that many of the old range men of Arizona are going out of business because of squatters coming in and filing upon the land.

The Live Stock Association of the Pacific Northwest is offering $100.00 for the best exhibit car of hogs which is entered at its Fair at Lewiston, Idaho.

The live stock market at Portland, Ore., is exceptionally good, and notwithstanding the big offerings of sheep and lambs, good prices are being obtained.

The handling and storing charges on grain in the warehouse at Lacrosse, Washington, are fixed at 50 cents a ton from time stored to next July 1st.

The demand for dairy cows is so great in both Oregon and Washington that Wisconsin, Illinois, and other eastern states are being drawn upon at an average price of $150.

The government forest school of the College of Agriculture, University of the Philippines, entered upon its second year last month. Graduates are assured a position in the Philippine forest service.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tanning Leather.

Please give method of tanning hides into harness and saddle leather.—Subscriber, Canadian, Texas.

For a 12 lb. calf skin take terra-japonica, 3 lbs; common salt, 2 lbs.; alum 1 lb.; put these into a copper kettle with sufficient water to dissolve the whole by boiling. The skin or skins will first be limed, haired and treated, as given in Cultivator of June 11. Then it will be put into a vessel with sufficient water to cover it, at which time you will put in one pint of the composition, stirring it well, adding the same amount each night and morning for three days, when you will add the whole, handling two or three times daily all the time tanning. You can continue to use the tanning liquid by adding half the quantity each time of new liquor and by keeping these proportions for any amount, and if you desire to give the leather the appearance of bark color you will put in one pound of Sicily sumac.

Leaf Fungus.

I send leaves of loganberries and blackberries affected with a rust or fungus which prevents bearing. Had a light crop last year but leaves this year continue to wither and dry up. What is it and how can I handle it?—Subscriber, Portersville.

Mr. C. O. Smith of the Southern California Pathological Laboratory answers: "The enclosed leaves of loganberry show a well-known leaf spot, Septoria Rubi. It is not a common practice to spray for this trouble, for, although the disease is rather common it does not seem to injure the growth of the vines to any marked extent. The fungus is to be found on wild and cultivated blackberries, dewberries and loganberries. If the trouble is likely to be serious, it probably could be controlled by spraying the vines early in the season when new growth is taking place, and about every two or three weeks afterwards until the fruit has reached almost full size. There is very little literature on this subject, but I would suggest Bordeaux mixture: 21 lbs. copper sulphate, 4 lbs. lime and 50 gallons of water. It is too late this season to do effective spraying."

Grafting Walnuts.

What is the right time of year to graft walnuts? What is the best variety from which to take the buds or scions? I would like to get a variety not susceptible to blight. Have planted California Blacks where I wish the rows of trees to come, and will graft later. They were planted in the spring of 1910. The following fall they were nearly an inch in diameter and I inserted buds, but did not succeed in getting them to grow. An effort at grafting this spring resulted similarly. What kind of wax is preferable?—Subscriber, Suisun.

The time for grafting is immediately before the starting of young growth in the spring or at the time of starting, and should be with scions cut some time before which are practically dormant. They can be preserved in moist sand, or if careful, in wet sacks. Budding has been less favored than grafting in the handling of walnuts. Instead of attempting to change the trees over at this age we would allow them to grow a few years until some size is attained. By that time a blight resistant or more largely immune variety may be developed. At this time there are many claims as to which is the best variety. The particular kind of wax is not a material factor save that in intensely hot sections the greater proportion of rosin is used to prevent running. Of the many formulas here is one which may be varied to suit the conditions: Rosin two pounds, beeswax two pounds, tallow one-fourth pound, a little linseed oil to suit. See Mr. Neff's article on walnut grafting in issue of March 26, '08, also Mr. Roeding's article in issue of Feb. 16 this year.

Indigestion.

Can you tell me what is the trouble with my little chicks? They droop around like one that is lousy, wings hanging down, and their crops seem full of water or air, some eat while others will not. I have three or four die a day. They are incubator chicks and brooded in fireless brooders.—X. Y. Z.

It is indigestion. The usual causes of indigestion in small chicks is first lice or mites, secondly wrong feeding, thirdly insufficient or dirty water, fourthly lack of grit, and chilling or overheating from crowding at night. Worms in the intestines and lack of green food will also cause it. You do not mention their age which might help one to diagnose the case, also you do not say if they have diarrhoea, so it is rather difficult to prescribe for them.

Try first to discover where the trouble comes in, and remedy it. Cut open the next that dies and look for worms. If they have worms give each droopy chick five drops of turpentine in half a teaspoonful of castor oil. Give green food and also give easily digested food such as bread and milk, or rice boiled in milk. If they appear weak give them raw egg well beaten with the same amount of pure olive oil. Give about half a teaspoonful of this every two hours till they are stronger. If you will write me how you feed, how the brooder is ventilated, the age of the chicks, etc., I can tell you better what to do than only guessing where the trouble comes in.

Russian Thistle.

I enclose piece of a weed which is new to my land this year. What is it?—W. A. D., San Marcos.

This is the Russian thistle in an early stage. It is found in many sections of California and does not seem to be the pest that it is in the Middle West, especially in the Dakotas.

Liver Trouble.

I have a rooster a year old which about two months ago began acting as if there was something in his throat. He could not eat, his comb got black, droppings were watery and greenish yellow. I gave him castor oil and in a week or so he got almost all right but he remained stiff and is still that way. What was the cause and what is the remedy? Can you tell me if chicks hatched out in September will do well and if they could be sold as broilers at Christmas time?—Mrs. S., Watsonville.

Your cockerel may have had something like foxtail in his throat. The blackness of the comb is almost always a symptom of liver trouble from too little green food and too much starchy food taken without enough exercise. The exercise is to keep the liver vigorous. With liver out of order the next thing that develops is rheumatism and that causes the stiffness in the legs. You might give him a little Epsom salts in the drinking water for a week, followed by bicarbonate of soda for another week. Give half a teaspoonful in a pint of water.

You can hatch in September, only be careful not to overheat either in the incubator that month or in the brooder when hatched. Give plenty of green food, also feed the parent birds for vigor, and do not feel disappointed if you have a good many infertile eggs at that season. It is a very good time to hatch for Christmas broilers. I always liked the early hatches in September and October and by imitating nature in the feeding I had very good luck.—Mrs. A. B.

Wild Sweet Pea.

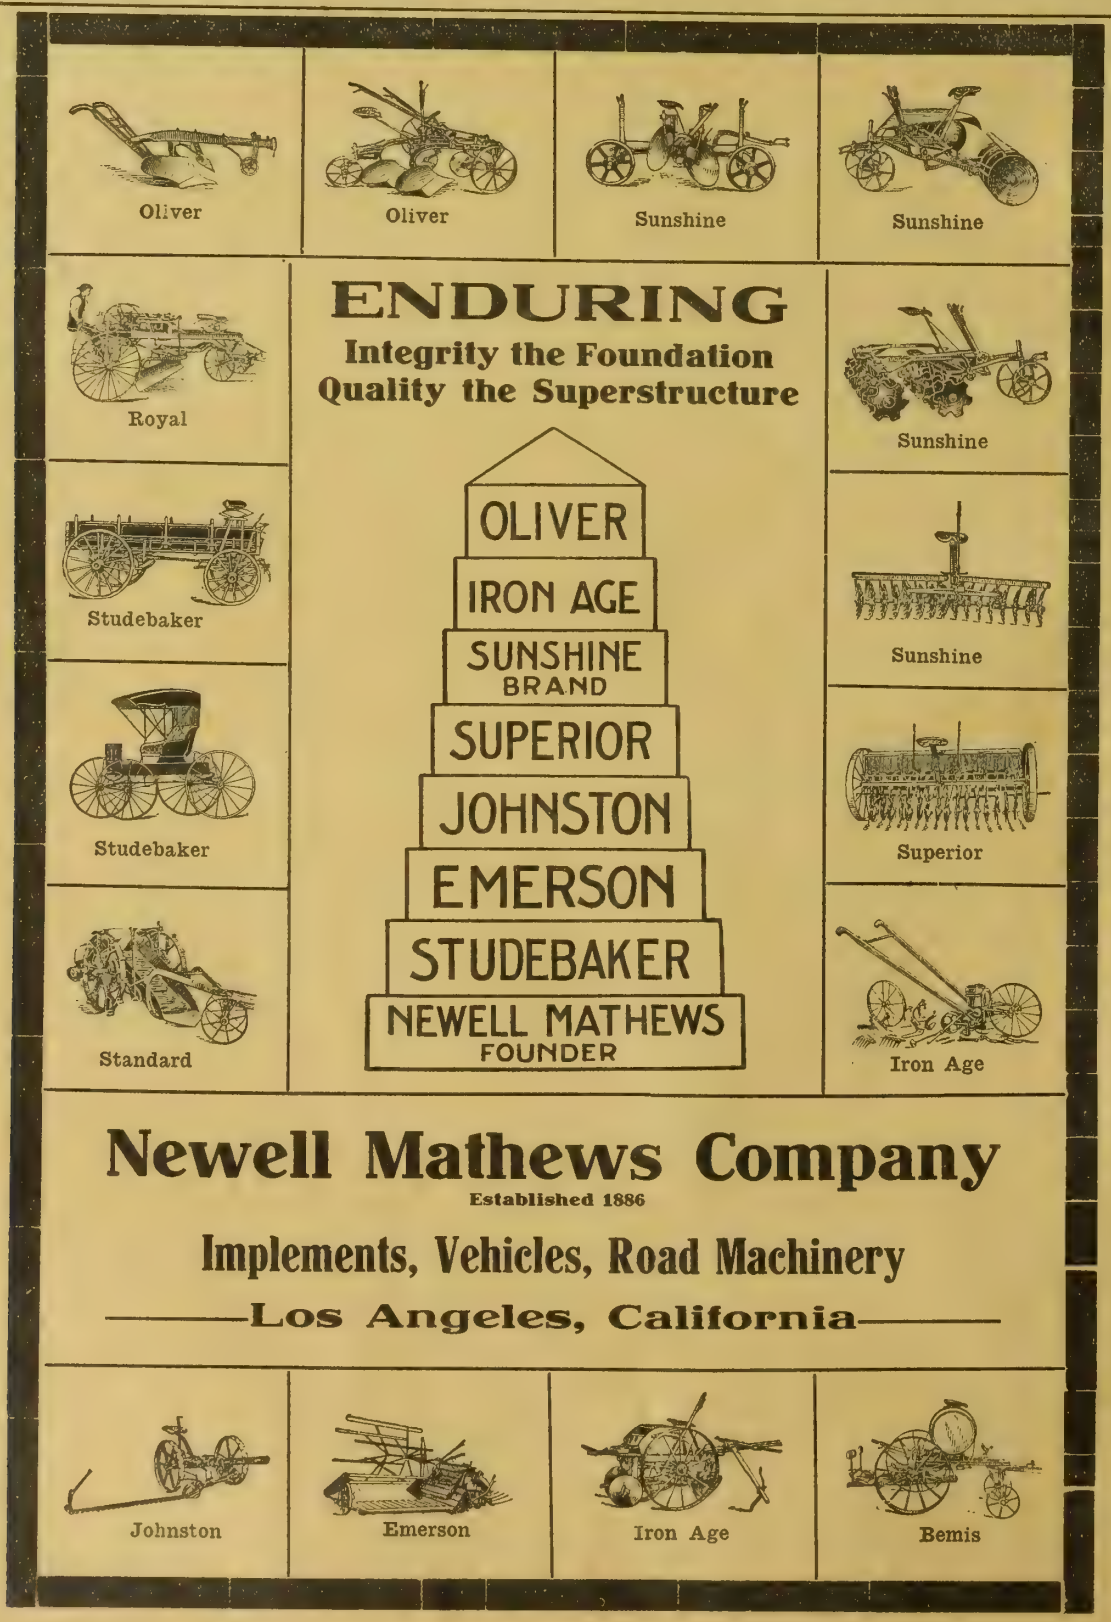
I enclose piece of wild sweet pea. Have had six horses die which were running on pasture where it grows. A veterinarian told me that they died from eating alfilaria, but it was my idea that this wild pea was the cause. —Subscriber.

This was submitted to one of the best botanists in California and he says that it is the Lathyrus lactiflorus, a common innocent plant.

Palo Verde Seed.

Is the seed of the palo verde tree which grows in abundance on the desert beneficial or harmful to poultry, hogs, or other stock?—P. J. H., Brawley.

We are unable to find out definitely as to the effect of this seed. Have



any of our subscribers had experience? If so, will they inform us?

Ants in the House.

I am troubled with ants in our house. They have been here for the past year and are increasing. From description think they are the Argentine. Also where can I get in touch with Experiment Station that will give me help?—Subscriber, Ioamosa.

We do not believe there is any better remedy in the house than buhach. If it is secured fresh it will drive almost any insect from the shelves. Scatter liberally wherever the pests are to be found. We have never known of a case where it failed. There are ant pastes and other remedies advertised, many of which are excellent. We may add that buhach is a California product, said to be the same as Dalmatian insect powder, but we have found it far superior. If the line the ants form in traveling to the house is traced back and the hole discovered, the whole bunch may be destroyed by use of sufficient boiling water, with carbon bisulphide or cyanide of potassium dissolved and poured over the ground and covered with a damp cloth, or various other effective remedies.—Exp. Sta., Berkeley.

Measuring Hay in Stack.

Please give most approved way of measuring hay in the stack.—Subscriber, Bishop, Inyo County.

No absolute method can be given, because of variation in different kinds of hay, and length of time since stacking. Of course, old hay which has settled for several months is more compact than new hay which has just been thrown up. Alfalfa is much heavier than barley. The weight also varies according to whether it is fine and short or has strawy stalks. Approximately we may say that a ton of hay occupies about 400 cubic feet. Therefore, to secure tonnage of a stack, multiply together the length, breadth and height to the eaves or angle at which stack begins to slope. This will give the cubic contents of the lower part of the stack. Then, to find the cubic contents of upper part, multiply length by breadth by one-half vertical distance from level of eaves to crest (if angle is reasonably regular). Add contents of upper and lower parts, of course keeping all dimensions in cubic feet, and divide the sum by number of cubic feet allowed to a ton, or, as we have said, approximately 400 feet.

Walnut Information.

I am looking for information regarding raising and culture of walnuts, also the latest varieties.—J. R. W., Fresno.

California pioneers, which we all are who are working in fruit culture in this state, must put up with many inconveniences and study out many problems which the next generation will have largely solved for them. Along the line of walnut culture there are yet many problems to be solved. So far as we know, there is no treatise on the subject. We doubt not the Cultivator has contained more than any other one publication, but these are so scattered through months, and even years, that it is hard to gather them together. There is a field for several books in fruit growing lines in California. Wickson's "California Fruits" touches upon the general topics of fruit culture, but only a very few pages are given to walnuts.

Making Soil Mellow.

Advise me as to handling adobe soil to make it mellow. It runs together badly and is very hard to work. Have applied a quantity of manure. It seems to be of no use, however. Will lime help?—C. M., Arroyo Grande.

The application of manure was a step in the right direction. Manure for this purpose, however, should be coarse and strawy and worked into the soil as thoroughly as possible. Lime is an added advantage and the application of 500 pounds or even a ton to the acre may prove advantageous. Be sure the lime is thoroughly air-slaked, for the fresh burned lime would be too caustic for the soil. For valuable garden spots we have known of good results to come from application of sand, which worked into the soil in time helps to make it more mellow.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

LIVE STOCK

Stallions for Sale—Acclimated animals. All harness broken, sound and gentle. Leader 40637. Dapple gray, 8 yrs. old. Ladoga Leon, 66619, 2 years old. Dark gray. Dam weighs a ton. Liberty 74310. Black yearling. These three are registered in the Percheron Society of America. Atwood, bay carriage stallion, 2 yrs. old. Solid color. Sired by Athadon, 1st dam by Junio, son of Electioneer. McKinney Don, 2 yrs. old. Solid bay with black points. Sire Stanford McKinney. 1st dam Belladonna, standard by trotting record. 2nd dam by Athaneer. Both well broken to buggy. Minnewawa Stock Farm, Fresno, Cal.

Grapewild Farm Herd of thoroughbred Berkshires. State fair prize winners. Boars and sows of all ages, unrelated. Address A. B. Humphrey, Mayhews, Sacramento Co., Cal.

Thoroughbred Belgians, White Angoras, New Zealand Reds and Silver Grey Flemish Giant Rabbits. List free. Caldwell Bros., Los Angeles, Cal.

A BALLAD OF BUTTERMILK.

It's fashionable now to churn
And drink the foaming buttermilk—
A dainty little crank to turn
'Mid wavelets delicate as silk.
The beverage of creamy snow,
'Tis said, will keep grim age at bay.
But where, I'd somehow like to know,
Where is the churn of grandma's day?

That churn was not of fancy art;
The dame of style would scorn it now,
And working it would quickly start
A crystal beading to the brow.
But when, with golden specks replete,
Up-splashed the cool, delicious spray,
What modern drink could be as sweet?
Where is the churn of grandma's day?

Within those frothing waves were blent
A thousand flavors, fresh and fine—
The elder-flower's floating scent,
The clover meadow's airy wine,
The perfume of a summer night,
The richness of a sunny May,
The tang of herbage crisp and light.
Where is the churn of grandma's day?

Madames who think you've found at last
A fountain of undying youth,
Where is the vigor of the past
That kept the spirit young, in sooth—
The simple life and wholesome fare
That held the worry lines at bay,
The exercise and pure, fresh air?
Where is the churn of grandma's day?

—Harriet Whitney Durbin, in Woman's Home Companion.

THE HORSERADISH PATCH.

"Oh, dear! Nothing but horseradish coming up!" exclaimed little Amy Willard as she walked across the half-acre garden patch behind the house. Then she quickly added: "I wouldn't care if every leaf was a crisp greenback, so we could get what Rachel needs, and keep her at school."

Suddenly a boy's voice called from the corner of the house:

"Say, Amy, I want you to help me dig some horseradish roots."

"Horseradish roots!" repeated his sister, half-contemptuously. "What do you want it for? We're all tired of it."

"I know we are. But it isn't Mother wants it. It's Mrs. Hamlen."

Jack and Amy were not long in digging up a generous bunch of horseradish roots, which were taken to the well and carefully washed and scraped. Then, putting them into a small basket and covering them neatly, they started toward Mrs. Hamlen's.

After praising the clean appearance of the vegetable, Mrs. Hamlen said:

"Here are twenty-five cents, and thank you both very much for your trouble."

"It—it don't seem right to take money for horseradish," stammered Amy.

"Not right to take pay for this nice horseradish " laughed Mrs. Hamlen. "Why, certainly it is. If some folks had your large patch of horseradish they would make a great deal of money out of it. I knew an old man, back in Illinois, who nearly supported himself by preparing horseradish for market every spring."

As they were hurrying home, Jack regarded his sister's thoughtful countenance for a few moments in silence; then he asked:

"Say, Amy, what you thinkin' 'bout so stiddy?"

"About what Mrs. Hamlen said of that old man who sold horseradish," she answered.

"What 'bout him?"

"Oh, nothing! Only I wondered if we couldn't fix up a lot of horseradish ready to use on the table, take it to the stores and get money for it. If we only could make enough to keep Rachel at school."

"I wish we could," Jack agreed heartily.

"Father," said Amy that evening as Farmer Willard smoked his after supper pipe, "won't you please let Jack and me have all the horseradish we want?"

"Great Scott!" he ejaculated, patting the wavy hair. "Don't your mother let you have all you want at the table?"

"It isn't that, Father. We don't want it to eat—for ourselves."

"What, then, do you want it for?"

"That's our secret. But may we have some?"

"To be sure. Take all you want of the stuff. There's enough of it to make blisters for every hospital in the land," he laughed.

"And, Father," she went on, coaxingly, "you'll take Jack and me to town with you when you go the last of this week?"

"Yes, you may go, if you're up early enough."

"We'll be up early," she cried, dancing off to whisper to Jack in the corner.

The way those two children extracted horseradish roots and cleaned and grated them for the next two days would have created a great deal of wonder in the mind of anyone not in the secret. The mother had to be let into the plan, and her suggestions and assistance were of much benefit to them.

The grated horseradish was put into empty glass fruit jars, of quart and pint measures, then covered with good, home-made vinegar. When they decided that they had prepared enough to experiment with, they had two quart and three pint jars full.

Bright and early Saturday morning, Amy was awakened by the redbird trilling a spring jubilee in the plum tree near her window.

"It's for Rachel," she repeated over and over as she dressed herself. "If we only can sell it, it will help a little, and maybe something else will turn up so she won't have to leave school."

When they reached town, Farmer Willard let them out on one of the main sidewalks, and promised to hunt them up as soon as he disposed of his grain at the mill and received flour and meal in exchange.

A little later, Mr. Thomas Davis, standing behind his counter, was surprised to see two country children deposit the basket on the counter before him.

"What have you here?" he asked.

"Horseradish, sir," answered Jack.

"Horseradish! Well, so it is," said Mr. Davis, taking up one of the quart jars and examining it. "All ready for the table, I see."

"We made it—Mother and us," said Jack. "Don't you want to buy it?"

"I have never handled any, except what is put up in bottles. But I suppose I might find sale for it," said the groceryman.

"This ought to be lots stronger and

better than that in the bottles," he said, upscrewing the lid from a jar. "Whew!" he whistled a moment later, the tears streaming down from his eyes. "I should say so."

Amy and Jack, remembering the abundance of their own tears drawn forth over the preparation of the horseradish, only smiled their sympathy.

"Well," said Mr. Davis, putting the lid back on the jar, "I guess I'll take it and risk getting my money out of it, if you will take groceries in exchange."

"Oh, please, sir!" cried Amy, her cheecks very red, "we can't do that, because——"

"No," Jack spoke up, 'we want money for Rachel."

'Rachel?" said Mr. Davis. "Who's that?"

"Our sister. She's at the 'cad'my, and we want to get money to buy her new books and new clothes, so she can keep on."

"I am sorry," said Mr. Davis, "but I can't pay you cash."

Then, noticing the disappointment depicted on the faces of the young venders, he added: "But I'll tell you what I'll do for you. If you wish you may leave your jars here, and I'll do my best to sell your horseradish, and give you the amount it brings."

Farmer Willard just then happened to come in, and the groceryman explained to him the proposition made to Amy and Jack, the result of which was that the jars were left with Mr. Davis to dispose of to the best advantage possible, and the farmer promised to return in a week and receive the groceryman's report.

A whole week to wait! Time had never seemed to drag so slowly to Amy and Jack before. But at last Saturday came, and Farmer Willard went to town again.

Amy and Jack did not accompany him, but they were waiting for him on his return. As he drove into the yard they caught sight of their basket with the jars carefully repacked in it, on the spring seat by the farmer's side. They had been hoping so strongly that Mr. Davis might find sale for their horseradish, but he had sent it back. Two very gloomy countenances greeted the farmer's smile.

"What are you two looking so glum about?" he asked, jumping out of the wagon. "Them jars have come home empty."

"Empty!" cried Jack.

"Yes," laughed Farmer Willard.

"Oh!" cried Amy, her bright look returning. "Did he really sell our horseradish?"

"Well, he did," returned her father in a happy tone. "Look here!" and he poured a whole handful of silver money into the surprised and delighted Amy's lap. "Sold it all, and wants more. Mr. Davis says he can dispose of all the horseradish we can take him by shipping it to some factory where they put up such stuff for the markets."

"Hurrah for the horseradish patch!" cried Jack, dancing gleefully around his sister, who could hardly realize their good fortune.

"Rachel can keep on at school; I'm so glad!" And happy tears shone in the blue eyes of the little girl.

Mr. and Mrs. Willard and the children all went to work eagerly in preparing the horseradish according to Mr. Davis' orders, and their receipts were more than sufficient for all Rachel's needs.

The Willard horseradish patch has increased in size, and it is a wonder to all who see it. The business started by Amy and Jack has developed into a considerable industry with them, and has enabled them to add many comforts to their humble home.

Rachel Willard is now a successful teacher in the district schools near her home, and is using the greater part of her wages to help pay off the mortgage and to educate her brother and sister.—Independent.

Heart-warmth is generated by the friendly touch of another's hand.

COOL WATER IN THE HOT SUN
"NO, MR SUN!!" YOU CAN'T WARM THE WATER IN THE APPELL WATER BAG"
APPELL
SOUTH AFRICAN WATER BAG
THE ADAM APPELL CO.
PORTLAND, OREGON

APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A lobe tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Hay.

Scott, Magner & Miller say:

There has been received on the San Francisco hay market for the week ending today only 1600 tons of hay, part of which consisted of old crop and partly new. This amount is much below the normal, and under usual conditions it might be expected that the market should have strengthened.

There has been no distinction made in prices realized here between old crop and new; the new is selling practically on the same basis of prices as the old crop.

Trading in hay in the country recently is reported as very light for the reason that the prices being asked in the hay districts are somewhat higher than can be realized therefor both in this city and in Oakland, and, therefore, purchasers act cautiously and are taking hold only to such an extent as their present requirements justify.

As the situation is now being better understood, and the harvest yield of hay better determined, it appears that the crop will turn out much larger in extent and somewhat better in quality than even the most sanguine had hoped for, and which in addition to the large carryover stock of old crop hay will make available a satisfactorily large tonnage. Export trade on hay at the present time is decidedly light.

Alfalfa hay is in light supply as the summer demand has not yet begun. There is no trading in alfalfa in the river districts as yet, as the market is still absolutely undetermined.

Deciduous Fruit Market

Manager F. B. McKevitt of the California Fruit Distributors, reports:

Sacramento, July 8, 1911.

The following gives number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, July 7, 1911:

Cherries—17 cars. This fruit is now nearly done. There may possibly be a few cars to report next week, but they cannot last long.

Apricots—37½ cars. A little more than half as many cars were shipped this last week as during the preceding one. Scattering shipments will continue to go forward for the next few days. Movement last year was 290 cars. It is doubtful if it will reach a total of 225 cars for the present season.

Peaches—63 cars. Again this week a slight increase in shipment is noticed. It probably will be considerably greater during the coming seven days, when a movement of approximately 100 cars is expected. St. Johns and Hales now constitute the bulk of the movement. They will continue in ample supply during the next ten days and will be followed by Imperial and Early Crawford. A few boxes of the former have already made their appearance.

Plums—141¾ cars. The plum movement is now in full swing and comprises the same varieties as those mentioned in Market Letter No. 8, namely: Climax, Burbank, Tragedy, Simoni, Abundance, Red June, with small shipments of Santa Rosa, Wickson and Ogons. All plums being shipped now are of fine quality and many of them grade as fancy. The crop of plums in the river districts and in Placer county will not be as heavy as expected earlier in the season.

Pears—12¾ cars. A few Bartletts are now going forward, but the fruit is still too immature in most cases to be attractive. Shipments will materially increase during the coming week, and the quality will improve from day to day.

There is no change in the grape situation, which continues generally very fine. A little mildew is being reported in the irrigated districts, but, having been quickly cared for, will probably not affect the output. Thompson Seedless grapes are expected to move out of the Imperial district next week.

Sales Manager Tucker of the California Almond Growers' Exchange reports:

Sacramento, Cal., July 8, 1911.

We are pleased to report the formation of the Colusa County Almond Growers' association, which has joined hands with us and will market almonds through the exchange this season. This makes the third new association for 1911 business and makes a total of fourteen associations now affiliated with us. Most all of the old associations have added new members to their list and our source of supply has been increased accordingly.

On July 14 the delegates from the various associations will meet in Sacramento and determine the price that we will ask for our crops this season. Market conditions at this time are very good and we will be able to secure a good price for our members. In spite of the fact that our competitors have made quotations in the east, the trade have not bought anything, as they are waiting for us to set the price. They recognize us as a factor in the almond business.

The idea of labeling the bags has made a "hit" with the trade and there is no question that this will pay us several times over for our expense and trouble in this direction.

This will enable us to supply bags and labels for shipping purposes without cost to our members. In view of the legislation now being enacted in different states,

was decided by the delegates at their ast meeting to begin selling this year n net weights. Growers who desire bags or hauling the almonds from the orchard o the shipping house can obtain sec-nd-hand bags from us at a very rea-onable figure. Barley sacks or lug boxes nay be used for delivering almonds to he warehouse.

Citrus Fruit Market

LOS ANGELES, July 12, 1911.

A surprising strengthening of the or-nge market is noted during the past week. It was expected that the extreme eat would boost the price of lemons, which it did, but that condition does not usually obtain with oranges. However, whether from burning up of small fruit crops and causing a dearth in the market or other cause, big prices are being ob-tained.

As noted, lemons are exceptionally strong, selling far above the foreigns, and in every auction market as well as in farther western markets every offering has been picked up at long prices. Fair-ly good fruit has readily commanded from $5.00 to $6.00.

Shipments.

Shipments of oranges to date since November 1st, 1910, 33,056 cars, lemons 5,278, total 38,834. To same date last season: Oranges, 22,779 cars, lemons 3,632, total 26,411.

NEW YORK, July 10.—Twenty-three cars Valencias, two cars seedlings, one sweets, one bloods and one car lemons sold. Market higher on oranges, strong on lemons. Weather fair. Hot.

THE HOME TESTING OF LINSEED OILS.

Use good oil for your paints. Poor linseed oil gives a poor paint. A poor paint soon becomes unsightly and gives poor protection to buildings against rain and sun. Poor protection causes rapid deterioration and calls for frequent repairs and renewals.

The Thirteenth Biennial Report of the Minnesota Dairy and Food Commissioner, just issued, states that one hundred out of one hundred and twenty-four samples of linseed oil examined did not comply with the state law controlling the sale of this product. Ninety of these illegal oils were found to be adulterated with mineral oil. The state inspectors confined their selection of samples largely to those oils which in their experience they have most often found adulterated. Consequently these figures indicate a higher percentage of adulterated oil than is actually to be found on the Minnesota market. It cannot be doubted, however, that there is a large amount of such oil sold.

To test your oil, place a piece of glass on a black surface, or preferably cover one side of the glass with black paint or enamel. Pour about a teaspoonful of the oil on the untreated side of the glass and hold in the direct sunlight. The presence of even small quantities of mineral oil can readily be detected by a distinct blue to green fluorescence, or play of colors, resembling somewhat the color noticeable on the surface of water when a little oil is present. Compare the appearance of the oil with a little machine oil treated similarly. Nearly all machine oils are composed principally of mineral oil and the fluorescence will be unmistakable.

A very slight fluorescence in linseed oil is not absolute proof of adulteration, but it is a very good indication of the presence of mineral oil, and oils exhibiting it should be rejected in favor of those showing no fluorescence, or they should be accepted only after chemical analysis has shown them to be pure.

The admixture of fish oil with linseed oil can often be detected by the sense of smell. The disagreeable fish odor is especially pronounced if the oil is heated and a small amount of the warm oil is rubbed on the hands.

Other forms of linseed oil adulteration cannot be readily discovered without the aid of a chemical analysis. Fortunately, however, the use of fish oils and other seed oils for such purposes is rare.

It should be noted, in justice to Minnesota linseed oil manufacturers, that all of the adulterated samples reported by the Dairy and Food Commission, with the exception of three of unknown origin, were manufactured outside the state.—G. W. Walker, Minnesota University Farm.

OLD TRACKS AND NEW.

A very attractive and interesting booklet on the subject of Portable Agricultural Railways, relating particularly to Portable Track and Light Tray Cars for fruit-drying yards, has been published by the Orenstein-Arthur Koppel Company.

Following a brief history reciting the progressive steps which have been taken by the American farmers from the era of the heavy and cumbersome farm wagon to the present era of the portable steel track and steel agricultural cars, and from the use of old-style wooden track to the present portable all-steel track, the booklet illustrates and describes many of the "Koppel" labor and money saving products.

The adaptability and use of the Koppel railway in vineyards, cattle ranches, dairies, etc., is likewise pointed out and local instances of installations are given.

The Koppel Company, 419-422 Chronicle building, San Francisco, or its Los Angeles agency, 120 South Los Angeles street, will mail this booklet on request, and it is to be strongly advised that all agriculturists, especially the fruit-dryer, study this subject before preparing for the transporting of products or the drying of fruit.

Give the Pomona Patent Pressure Gate a Trial

No rubber or wooden facing to rot or wear out. Absolutely water tight when closed. Locking mechanism is protected against rust or clogging with sand or dirt. Simple in construction. Cheap in price and as durable as solid iron.

THE LOCKING DEVICE is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

The Sweetest Little County in the State

The Anaheim Sugar Factory, One of Five in Orange County

The Anaheim Sugar Company has completed a 700-ton plant t a total cost of $850,000, which includes a complete pulp drying lant. The Company has this year under contract 6000 acres of eets with a conservative estimated tonnage of 60,000. The fac- ory will begin operations next Tuesday. The completion of this ctory and the one for the Holly Sugar Company at Huntington each will make four sugar factories in operation in Orange County. nother year a new factory will be completed on the San Joaquin anch, below Santa Ana, with a daily capacity of 600 tons of beets and also a new factory to be built by the Cerritos Sugar Company near Hynes, just inside Los Angeles County, which will make a total of six sugar factories in this section of Southern California, which will produce approximately 1,200,000 pounds of sugar daily during the campaign which lasts about 100 days, with a total for the campaign of 120,000,000 pounds, worth approximately $6,000,000, which gives an idea of the magnitude of the industry for one little county. There is ample acreage to supply the beets for six factories, with a reserve acreage of suitable beet lands not yet under cultivation to provide in the future for a rotation of crops.

Vol. XXXVII. No. 3. LOS ANGELES: THURSDAY, JULY 20, 1911 One Dollar the Year

The Brown Spot of the Navel Orange

By Dr. J. Eliot Coit, Southern California Pathological Laboratory,
in Proceedings of the Society for Horticultural Science.

There are a large number of spots, cars and other blemishes which tend o reduce the quality and grade of ranges or cause them to be thrown n the cull heap. The writer has un- ertaken a study of all blemishes of alifornia oranges and has now under nvestigation thirty separate and dis- nct kinds, any one of which may be esponsible for lowering the grade ith a consequent reduction in the oney returns. The relative impor- ance of these varies widely in the ifferent packing houses and in dif- erent years. Averaging the results rom counts in a number of houses is year, we find that the most im- ortant of these are splits, brown pot, calluses caused by the wind mov- ng the fruit which is hanging low nough to touch the ground, thorn unctures, sun burns, thrips scars and orm holes caused by Tortrix cit- ana. At the present time there are en out of the thirty kinds of blem- shes, the causes of which are not un- erstood, the two chief ones being rown spot and splits.

On December 5, 1909, a car of Navel ranges was packed in the vicinity of iverside. This car was billed to hicago. On its arrival the agent here reported the fruit in good condi- on, but with a slow market he was id only $2.60 per box. The car was herefore diverted to Boston and on s arrival there, three weeks after ate of picking, the fruit was reported o badly spotted that the agent was ble to secure only $1.80 per box. In his case, which is typical of a great any, sufficient brown spots developed hile the car was going from Chicago o Boston to entail a loss of $307.20. t is impossible to estimate, with any egree of accuracy, the total loss aused by brown spot, for the agents n the eastern markets fail in most ases to differentiate between the any kinds of spots. Then again, hen a market is slow an agent will ften report fruit as slightly spotted, hereas had the market been brisk, uyers would not have been so critical nd spot would not have been men- oned.

escription of the Brown Spot.

The brown spot of the Navel orange ay be described as occurring irregu- rly over the surface of the orange. rom one to fifty or more spots may evelop on a single fruit. The spots ary in size from a mere point to one ch in diameter, averaging about one- ourth inch. In outline they seem to llow no rule and may be quite irreg- lar, although the circular spot is ost common. The color of the spot aries in different localities from a ale brown, which attracts little no- ce, to almost a black, in which case e good appearance of the fruit is ined. The eating qualities of spot- ed oranges are not injured in the least. The color of the spot seems to be lighter near the coast and darker in the interior valleys. Losses from brown spot have been heaviest from the upper San Gabriel and Santa Ana Valleys because in these regions the spotting is more common and the color changes to a darker brown. On the other hand, the fruit from many of the packing houses near the coast shows brown spots of such a pale tint as to attract no notice on the market. The spots are darker on early picked fruit, and it seems to be true that if the fruit is left on the trees until very late it will not spot at all. The spots are slightly sunken on account of the fact that the surface cells have collapsed. The dead and collapsed tissue extends from the surface to about one-fourth the thickness of the rind. In 1909-10 no spots were visible while the fruit was on the trees and as a rule the spots are not noticeable till from 15 to 25 days after picking. On this account it is not possible to grade against this spot in the packing houses, unless storage houses of sufficient capacity are built to hold the pickings of three or four weeks. This year, however, I have found a very few specimens of fairly typical brown spot on the fruit on the trees.

The brown spot has been observed so far only on the Washington Navel variety of orange. Spotting is also uniformly worse on fancy smooth, thin-skinned fruit. The fruit which grades highest as it comes from the orchard always spots much more than the rough fruit, which often remains exempt. Examination of the spot with a hand lens fails to show any abrasion or opening in the epidermis.

Orange packers have been complaining of the brown spot for only four or five years, but it is probable that it has existed, though varying in severity, as long as the Navel orange has been cultivated in California.

Investigations of the Cause of Brown Spot.

It may be stated at the outset that nothing has been found so far which would seem to indicate that the brown spot is caused by parasites such as fungi or bacteria. It appears to be purely a physiological disease. The writer has not been able to find in scientific literature a description of any disease strictly comparable to the brown spot, and we have been thrown entirely on our own resources in searching for a cause. The nearest approach to a parallel case seems to be the "Bitter Pit of the Apple," as described by I. B. Pole Evans, of South Africa; D. McAlpine, of Australia, and various investigators in this country. The bitter pit, however, differs markedly in that the pits occur to a large extent before the fruit is picked from the trees.

Ralph E. Smith found that the normal rind of a green orange functions as a leaf and manufactures starch in abundance. With the disappearance of the chlorophyl at maturity the remnant of starch is changed to sugars, the fully mature orange containing no starch in the rind. It was found, however, that the brown spots gave a distinct reaction to iodine, showing that in these diseased cells the diastatic action was in some way inhibited.

Smith also found that freshly-picked fruit, upon which the spots had not yet become visible, when decolorized and treated with iodine would show blue spots indicating the presence of starch at those places which would have turned brown later. This seems to indicate that the trouble originates while the fruit is on the tree and suggests the presence of some enzyme which inhibits diastatic action during the time the fruit is coloring. Smith also observed that the coloring of the fruit was more rapid, and the starch normally disappeared from the rind more quickly in those localities where the brown spot was more severe.

Investigations have been carried on along many different lines of inquiry and while the results are so far all negative, they are presented here on account of the possible value of such negative results in narrowing down the investigation and because of various interesting by-products.

Various Experiments.

In experiment No. 1 it was found that the position occupied by the fruit on the tree seemed to have no appreciable effect on the liability of the fruit to spot. Several trees were selected in one orchard, the fruit from which had spotted badly. On Feb. 4 a number of sound oranges were picked from the north, east, south and west sides and also from the inside of the trees. The fruit was stored in the packing house and when examined three weeks later was found to be 53 per cent spotted, the spots occuring about equally in each of the different lots. Experiment No. 1 was conducted by Mr. H. J. Ramsey at the instance of Professor R. E. Smith, who later turned the work over to the writer.

In experiment No. 2 it was shown that if the oranges were picked before October 1 or before they had begun to color, that as they gradually turned yellow in storage, spots would appear which would remain green instead of turning brown. Such green spots are usually from three to five times larger than typical brown spots.

An impression was prevalent among the growers that the spotting was worse on fruit grown at the higher elevations along the slopes of the foothills. Accordingly in experiment No. 3 fruit was picked from different orchards in order to test this point and to bring into contrast other conditions. Fruit from orchards on the foothills was contrasted with that from the low level land. Fruit from heavy red soil was stored beside that from light sandy soil. In all, many boxes of fruit were collected and stored from each of eleven different localities in Southern California. After the fruit was examined three weeks later and all the figures tabulated it was found that the spot varied from 8 to 89 per cent in the different localities, but a careful study of the figures failed to show any correlation between soil type and brown spot. In one locality the foothill land or the heavy-land would show the most spot, while in another locality just the opposite would obtain. In general, it was found that near the coast a longer time elapsed between picking the fruit and the appearance of the spot and the spots averaged a lighter brown and were less objectionable than in the interior valleys where the soil contains less humus and much higher temperatures prevail in summer.

Experiment No. 4 was planned to determine what effect the retardation of the loss of water by evaporation from the fruit would have on the development of spot. It was thought that if the brown spot could be controlled by checking evaporation that the substitution of heavily waxed paper for the ordinary tissue wrapping paper would constitute an easy and thoroughly practical remedy. Accordingly a number of oranges were picked, using care to avoid any abrasions or bruises. These were placed under bell jars on tables in the laboratory at ordinary room temperatures. It was found that if the skin of oranges was not broken in any way that the fruit would not rot, but would remain in good eating condition for six or seven months. The oranges used as checks which were left outside of the bell jars lost water rapidly, but did not decay. They eventually became as hard and dry as wooden balls. Unfortunately for this experiment, no spots developed either on the checks or the bell jar fruit. A more practical experiment was next tried in the packing houses. Different lots of fruit were wrapped in each of three kinds of paper, using wax paper, a parchmyne paper imported from Germany, and ordinary orange wrapping paper. This work was carried on in twelve different localities, including four counties, during January, February and March, 1910. When the figures were all brought together and tabulated and averaged, it was found that the following per cent of spot occurred under the different papers: Waxed, 42 per cent; parchmyne, 53 per cent, and common wrappers, 50 per cent. The results were decidedly disappointing, especially in view of the fact that the results were not at all uniform. In some cases the waxed paper showed the

least spot, while in others the opposite was the case.

In experiment No. 5 an attempt was made to artificially produce the brown spot and many other forms of blemishes by cutting, bruising, scratching and kneading the green, half-grown fruit, and also by spraying or dropping on the green fruit various acids and other caustic substances calculated to cause injury. The results of this work gave us hints as to the causes of a number of common blemishes as ordinarily met with in the packing house, but no brown spots rewarded our efforts. Even where the fruit was gently kneaded between the balls of the fingers without in any way injuring the surface, the fruit after picking failed to develop spots which would correspond with the points where pressure had been applied.

While it seemed fairly certain that the brown spot was not caused by parasites, it was thought best to leave no stone unturned, and in experiment No. 6 the fruit was soaked in disinfectants. Lot a was soaked one minute in copper sulphate solution (1 pound to 1,000 gallons) and later developed 36 per cent of spot; lot b was soaked one minute in permanganate of potash solution (½ pound to 1,000 gallons) and later showed 16 per cent spot; while lot c, which was left untreated, developed only 8 per cent of spot. These results showed that disinfectants at least did not reduce the amount of spot, and the experiment as a whole was devoid of any interesting results.

Experiment No. 8 carried us into the field of entomology, for we could not ignore the possibility, however improbable, that brown spot might be an after effect of some insect injury. Accordingly, every kind of sucking insect at all common around the orchard was placed under suspicion and watched. In some cases cages of glass and cloth were made and a half-grown orange enclosed with several individuals of one kind of insect. So far no positive results have been secured, although these experiments are still in progress and a final report cannot be given at this time.

Oranges were found to spot badly before any frosts had occurred, and it can be said with certainty that the spot cannot be due to the effects of frost.

Fruit was also put up from fumigated and non-fumigated orchards, and the results showed that the spot developed without respect to fumigation. Fumigation burns, moreover, are easily recognized, and form a distinct class of blemishes.

Experiment No. 9 consisted in a series of experiments which were made in the effort to produce the brown spots by injecting into the rind, with a hypodermic needle, various substances calculated to affect it injuriously. Some of the substances tried in various strengths were alcohol, ethyl nitrite, formic acid, distilled water, air, oxydase extracted from brown spot tissue, and enzyme extracted from green persimmons.

Conclusions.

None of these attempts to produce the brown spot were successful, although some very interesting observations were made. It was found that an injection of distilled water caused the rind to increase in thickness from 75 to 100 per cent at that point, resulting in a small circular protuberance about one-half inch in diameter of hard, dense tissue with thicker wadded cells. The oxydase injected seemed to produce very little effect worthy of extended description. The most important observation afforded by this experiment may be described as follows: Whenever a chemical such as alcohol or acid was used the tissue was immediately killed in a symmetrical circular area, the diameter of which varied with the amount of chemical injected. These dead spots at once lost water, becoming dry and hard. After two or three weeks a ring about one-sixteenth of an inch wide immediately surrounding the dead tissue appeared to collapse and present an appearance exactly similar to brown spot. The width of this brown spot ring was seen to increase slightly for several weeks after the orange was picked. This observation suggested that oxydizing enzymes, which may have been set free by the death of the chemically-killed cells transfused into the adjoining living cells, and since these cells were no longer receiving food solutions or manufacturing starch (the epidermal cells having lost their chlorophyl and turned yellow), they were unable to resist the effects of the encroaching ferment.

These observations led me to conclude that the direct cause of brown spot is the oxydation of the protoplasm by enzymes which occur in the protoplasm itself but which are prevented from acting as long as the orange is joined to the tree and receiving water and certain nutritive substances from the tree. Thus the resistance of the protoplasm to enzyme encroachments gradually grows less from the time the orange is picked.

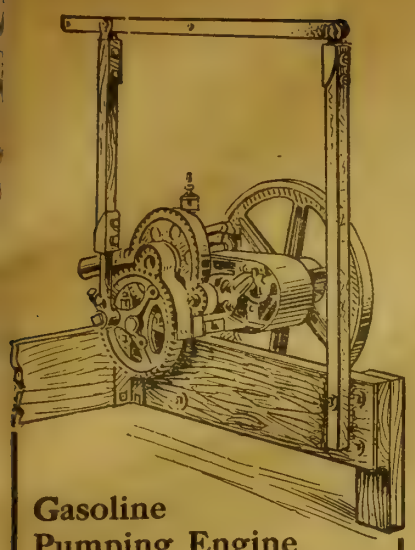
Thus while I may attribute brown spot to a premature death of certain groups of cells lying at and near the surface, this only takes the real question one step further back, for the practical citrus men will, of course, wish to know the primary causes which bring about such premature death and an economic method of preventing it.

Meanwhile the investigations are being continued in an attempt to answer this perplexing riddle, and any suggestions from others who may be working on similar problems in other parts of the country will be considered with appreciation.

RUSSETING OF FRUITS.

Usually the rust mite does not occur in a grove later than the middle of July. Some years, however, it continues to work vigorously late in the fall, and in some groves as late as into January, causing bright fruit to russet even after it had become ripe. Last spring was exceptional in regard to the activities of this little pest. Ordinarily it need give us no concern before the middle of May. Many of us, however, were unpleasantly surprised to find that the crop of fruit had been greatly damaged by it before the first of May.

The rust mite is the smallest animal belonging to the spider family. A single individual cannot be seen by the ordinary eye. Nearly every one, however, can detect rust mites by the unaided eye when they occur in countless numbers on citrus fruits, as they are likely to do some time during May. They may be detected on the fruit by a very delicate light coloring, as if the fruit had been dusted from a roadside. When this inconspicuous dusty apearance occurs, one should use the hand lens to determine whether this condition is due to dust which has arisen from the soil, or whether it is due to myriads of rust mites on the fruit. If it is found that the rust mite is present, this is a signal for immediate action.



Gasoline Pumping Engine

Complete Ready to Operate for

$42.50

These air-cooled Pumping Engines will pump the same quantity of water as an 8-ft. windmill. They will pump any or all the time, whether the wind blows or not. They are sold complete ready to operate, are easily set up and will give entire satisfaction for years if properly oiled. About one pint of gasoline in four hours is required.

When writing to CULTIVATOR advertisers **BE SURE** to say where you saw their advertisement. It will cost you nothing and **MAY** to you some good.

The rust mite, like other spider mites, is extremely sensitive to sulphur compounds; consequently we have a cheap remedy in almost all kinds of sulphur mixtures. The most effective, and at the same time, one of the cheapest, is the sulphur spray, made of sulphur and caustic soda. The lime and sulphur mixture is also very effective. Only two quarts of these sulphur solutions are usually needed to forty or fifty gallons of water.

A less effective, though somewhat cheaper method of treating rust mite is by means of flowers of sulphur. This is a fine powder of brimstone and may be applied with a powder gun. Before the invention of these powder guns people treated citrus groves effectively by throwing handfuls of powdered sulphur into the trees. A mixture of flowers of sulphur with about three parts of air-slaked lime is a little more easily applied, and sticks to the leaves better than the sulphur alone. By mixing the lime with the sulphur the workmen are able to see what parts of the tree have been treated, and so do the work more thoroughly.

The dry insecticides for rust mite should only be applied when the trees are moist with dew. In a large grove this requires much night work, to which most laborers object.

Other forms of contact insecticide may be used more or less effectively, but should be avoided unless one has in mind the double purpose of destroying rust mite and scale insects at the same time.

A grove that is kept thoroughly irrigated is not apt to be badly affected by rust mite, since these mites do not endure a moist atmosphere. It is however not safe to rely upon an irrigating plant as a preventive of russeting of oranges.—P. H. Rolfs in Florida Agriculturist.

A NEW MANGO.

A new mango to which our attention has been called fruited for the first time this year. It is known as Langra Benarsi, and is an importation from India. The fruits are entirely free from fiber and are very large. Specimens on a young tree just commenced bearing weighing three pounds and one ounce, and measuring nearly eight inches long. Promises to be very prolific and is a strong grower. Flavor is rich and spicy. Fruit is yellow or greenish yellow and is oblong.—Modello Tropical Topics.

INFLUENCE OF FLOWERS.

Children reared in homes where the parents are indifferent to the appearance of the home grounds are indeed unfortunate, for they lose nearly all chance of acquiring that love of the beautiful which is so elevating, so ennobling.

Those who early in life become imbued with a love of nature through home influences, carry it through life and it is a constant source of pleasure, not only to themselves, but to all who come in contact with them—an intense love of nature which marks them above their fellows. History proves that a taste for gardening has kept pace with the progress of civilization, and that it has always exerted a powerful influence upon the passions and feelings of mankind.

The Farmers Club at Ukiah, Mendocino County, has proven itself able to handle practical marketing questions as well as making itself a social and literary factor. At its last meeting a fine poultry exhibit was made.

THE APHIS AND THE STATE LAW.

(The following statement by Prof. Woodworth makes his position rather clearer than his former article, and we give place to it willingly, though we feel it wiser to close the argument with this number, unless Commissioner Jeffrey wishes to reply, as he is entitled to.—Ed.)

By C. W. Woodworth.

It is not at all undesirable to discuss freely such matters of public interest as the horticultural law. In a recent number of the Cultivator, State Commissioner Jeffrey has opened up the question in a very satisfactory manner though taking different grounds from those presented by me in a former issue.

Mr. Jeffrey's article is largely given to disproving two propositions which are entirely foreign to my views. 1st. It was not intimated that the whole law, nor even a large part of the whole law was unconstitutional. I was perfectly aware that many points had been approved by the supreme court, indeed all the points mentioned by Mr. Jeffrey have long been matters of common knowledge through publication by the state commissioner. The point which I mentioned, however, has never been adjudicated and probably never will, since any commissioner would back down before allowing it to come before the court. 2nd. No question was raised as to the constitutionality of the law in requiring certain police duty as long as that duty could be performed without violating rights guaranteed by the constitution.

I did point out that health laws in addition to the common police regulations also provide for extraordinary police powers which would be unconstitutional for any other purpose than the prevention of epidemics, and that the horticultural laws cannot rightly claim these greater powers simply because of similarity of wording, and in this I am sure Mr. Jeffrey will fully agree. Sometimes a case arises like that of the black peach aphis where the ordinary police powers are inadequate, cases where public interests would seem to demand the destruction of property. The orchards in question are valuable properties notwithstanding the presence of the aphis. The cost of the treatments that were required were out of all proportion to the possible benefits that might come to the owner of the orchard. The only possible justification of the work was the benefit that might accrue to the community at large in event of complete eradication of the insects. The work, if completed, bids fair to require the complete destruction of the infested orchard, and if not to be completed no public benefit whatever has been secured, though already there has been considerable loss to the orchardists concerned.

The only just way, and the only constitutional way, such work can be done for the public benefit is to provide for the cost out of public funds. This was not by any means intended as "vague criticism" but as the presentation of a workable plan for accomplishing a public service for which the police powers created by our horticultural law cannot be made effectual.

The real fundamental question in this whole matter is the meaning of the law in the use of the word "eradicate." Mr. Jeffrey urges that it should be considered synonymous with "abate."

The work at Lankershim was in no sense an effort to "abate" the trouble. The cost of the work was many times greater than would be necessary to prevent the insects doing serious injury. The kind of work done against the black peach aphis was strictly an attempt at complete eradication and was done professedly under the state law. If Mr. Jeffrey is correct in his contention that the whole purport of the act is in opposition to the strict interpretation of the word eradication the county commissioner exceeded the powers conferred upon him by the law in attempting to do more than abate the nuisance.

If Mr. Jeffrey is correct in this the horticultural laws mean quite a different thing than that which many county officers have supposed.

If such is the real intent and purpose of the law, then the most important improvement that can be made is to write this meaning, in plain language, into the law so that officers operating under the law will not make the mistake of supposing their duties require them to attempt to eradicate insects.

Historically there can be but little doubt that the original framers of the horticultural law intended real eradication. The codling moth and the San Jose scale had but recently been introduced into the state. They did not expect to have to adjust their horticultural methods so as to continually fight such pests, but looked for the times when they might be relieved of them entirely and expected the law to be the means of driving these pests out of the state.

The law has been revised and amended from time to time changing such things as the number and compensation of the county commissioners, but no restating of the essential features of the law has ever been attempted, notwithstanding the fact that nearly every one has long since given up the idea that our important insect pests will ever cease to be a factor in fruit growing in this state.

Every now and then a zealous horticultural officer will attempt to require the eradication of an established insect, and put a lot of people to needless expense, and after a little while he sees how really impotent he is and gives up the work.

People are generally so law-abiding that they are inclined to accept anything that comes with the semblance of authority. A horticultural commissioner thus even when clearly exceeding his authority can inflict serious financial loss on the community.

The law should clearly prevent the requiring of unnecessary and hopeless sporadic efforts.

On the other hand it would be very unwise to eliminate the idea of eradication from the horticultural law. When insects have not become established they can be and have often been, eradicated. Horticultural officers have done their best work in the eradication of such pests being introduced on nursery stock. We have no reason to believe that the most careful inspection will prevent the ultimate introduction of the in-

sects, and they will surely become established sooner or later if the effort towards eradication is limited to the inspection of nursery stock.

There will be no difficulty in deciding in the extreme cases whether eradication or control should be undertaken. No one hopes to eradicate the codling moth, for instance, and all hope to be preserved from having to try to control the fruit fly. Between these two extremes lies the difficulty. At the one extreme enormous property values are involved, and great expense would be required in an effort at eradication. At the other extreme little or no actual property is at stake and the cost of eradication is also nominal.

It has been the common practice to make a double interpretation of the law and give each case its logical treatment. The inadequacy of the present law comes out most prominently in the more difficult cases where there is considerable property involved and where an attempt at eradication is desirable, though expensive, and where the outcome is doubtful. Just such a case was that at Lankershim, where I assumed that the law applied but was unconstitutional when so applied and where Mr. Jeffrey, upholding the law, makes doubtful its applicability to such an effort at eradication.

The law should be so worded that there could be no ground for doubt that it did apply and so that no valid criticism could be made respecting the equity of its operation.

When an insect has gained a foothold but is not so fully established as to make eradication hopeless no one will question the desirability of attempting to eradicate it. Eradication work is very sure to fail if left to the property owner as provided in the present law, as long as "an earnest attempt to abate" is construed as compliance with the law. The insect need not become very widespread before the cost of a campaign that offers any hope of success is too great to be in justice chargeable against the property since it would often amount practically to confiscation.

The new law, when it is made to really practically meet such situations, should provide full indemnity for those whose property is to be destroyed or injured. If the pest in question is a recent introduction into the state, the legislature should provide for the work and the state commissioner should have some funds always available for emergencies. If the insect is already established within the state as is true of the black peach aphis, any county or community could provide the necessary funds for the attempt at eradication. The state legislature and the county boards of supervisors, upon the expert advice of the state or county commissioners would be the judges of the status of the pest in these doubtful and difficult cases. County ordinances making such provision would not be in conflict with the present state law and such was the practical suggestion made in my former article.

In conclusion, I can approve most heartily Mr. Jeffrey's suggestion that an attempt be made to improve the present horticultural laws and would like to suggest the appointment of a strong committee on that subject at the next fruit growers' convention, including representatives of all interests, and suggest further that it be instructed to consider especially such essential features of the law as those raised in the present controversy.

POLLINATION OF ORCHARD FRUITS.

More than 100 years ago (about 1793), the German botanist, Sprengel, published a book in which he showed as a result of his observations the part insects play in the pollination of flowers. This work, many statements of which have been disputed, proved a stimulus for further work and observation in pollination of fruits. Sprengel himself probably did not understand how important cross-pollination is in nature.

Later, Andrew Knight, in England, carried on experiments in cross and self-fertilization of the pea, which showed that it was probably intended in nature that plants should be cross-fertilized.

Darwin was the first to establish clearly the true value of crossing and show the interesting modifications of plants to aid in cross-pollination. In Darwin's "Origin of Species," cross-fertilization is especially emphasized. But it was not until some time later that much attention was paid to his theories.

M. B. Waite, of the Department of Agriculture, Washington, conducted some very valuable work with apples and pears about twelve years ago. Since that time many experiment stations and a few individuals have made systematic studies of this and many other plant-breeding problems.

Many plants are sterile, as far as their own pollen is concerned, but will readily respond to pollen from other plants. Some fifty plants are known to be thus self-sterile, but they will bear fruit if pollenized with pollen from other plants. C. I. Lewis, of the Oregon Experiment Station, Corvallis, Ore., has found that out of eighty-seven varieties of apples worked with, fifty-nine varieties were self-fertile, fifteen self-sterile, and thirteen varieties partially self-fertile.

Many varieties naturally tend to be sterile when limited to their own pollen and a knowledge of these is important in pollination work. A sterile variety is one that will not fertilize its ovule with its own pollen; the pollen of a fertile variety will do this. Investigators have found that climatic conditions affect the sterility and fertility of varieties, so that tests must be made in different climates.

The method employed to test this is to enclose the blossoms in manila bags before they open, thus preventing any outside pollen from entering the flowers; and if the blossoms fail to set fruit after the pollen has been distributed on the stigmas, the flowers are said to be self-sterile.

Among self-sterile varieties of apples, according to Lewis, are Early Strawberry, Gravenstein, Haas, Jonathan, McMahon White, Pewaukee, Rome Beauty, Salome, Tolman, Sweet Transcendent crab, Wealthy and York Imperial.

Self-fertile: Baldwin, Grimes' Golden, Duchess, Scott's Winter, Shiawassee and Yellow Newtown.

Partly self-fertile: Ben Davis, Whitney and Yellow Transparent.

It has been found that certain varieties make better pollenizers of varieties than others. For example, better results were obtained by crossing Spitzenburg with either Jonathan or Baldwin than with Newtown, and very much better than when self-pollenized. In determining the pollenizers for any variety, we must choose those that blossom at the same time as the one to be pollenized, and they should bear a large quantity of pollen, although this is not essential.

In planting an orchard, it is well to set alternately about two rows of a variety that is weak in pollen, and then two rows of one strong in pollen, etc. They must be close enough so that insects will visit each easily. Wind has been found to be a poor conductor of orchard pollen.

The floral envelopes of flowers tend to attract bees and insects, but they quite readily visit flowers not having conspicuous floral envelopes or where the envelopes are gone.

Climatic conditions have considerable influence on the blooming periods of fruits. In cold, frosty localities, varieties should be selected in reference to their blooming periods, and success will more often result.

The length of time that pollen will keep varies. It may safely be kept two or three weeks, and even longer if not allowed to ferment.

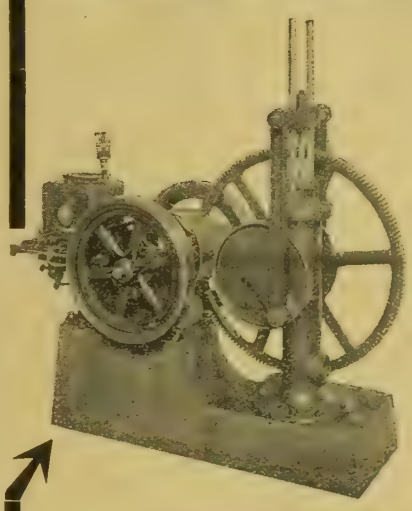
In the work of cross-pollenizing at Corvallis, it was shown that immediate effects of pollen on color of fruit were seen. Also the crossed apples were heavier, and the seed was also heavier. Many of the self-sterile varieties when self-pollinated were found to be seedless or had small seeds. When the self-fertile varieties were cross-pollenized, an improvement in size was noted.—Southern Fruit Grower.

BLACK PEACH APHIS.

Speaking of the effect of black peach aphis, Prof. Warren T. Clarke recently cited the case of profitable bearing trees which were badly infested with black peach aphis as far back as 1902. These trees are located in the orchards of Mr. Geo. D. Kellogg at Newcastle. Sometimes for two consecutive years no aphis will appear, but the following year they may require considerable attention. The cost of control is not so great that the orchard has ceased to be profitable.

One method of control where the aphis is not bad is as follows: As they emerge from the ground they usually make their first attacks on the lower limbs, especially on suckers or water sprouts coming near to the base of the tree. These suckers should be watched and as the aphis appears, the sucker growth should be cut and burned immediately or the aphis destroyed by the use of a blow torch. This prevents their spreading to the upper branches of the tree.

Have You Seen **Gregory's Triumph Engine**



with Direct Connected Pump Jack?

If you have not, you have not seen the latest thing in a perfect little pumping plant. Note the simplicity of this jack; direct lift each side of the piston; no wobbling or jerking, but a smooth, even stroke. Engine is fitted with pulley, so that you can run the washing machine, the churn, the cream separator, and be such a handy little helper about the place.

We have them in 1 and 2 H. P., and don't forget that we carry a very large stock of engines and pumps of all sizes. Come and see us, or send for catalogue.

The Land of Opportunity

Never in the history of the world was there a greater certainty of making money than buying Panama Government Lands at the present time. Price $5.00 per acre—$2.50 down and $2.50 in four years, with no taxes to pay until one year after final payment is made.

The opening of the Panama Canal will, almost in the twinkling of an eye, give this heretofore closed region access to the markets of the world.

In the Province of Chiriqui is a belt of citrus fruit land which cannot be surpassed on this continent, where oranges ripen in November, and are ready for the market at a time when there is no other fruit available, and when they will command the highest price.

In the Province of Cocle, which is a short distance from the City of Panama, and directly on the line of the new railroad being built into the Province of Chiriqui, we have some very fine Sugar Lands. There is an American Colony to be established at this point, and a Sugar Mill is now being erected.

We will arrange to cultivate these lands on terms or on shares as you may desire. The profit sharing to continue only long enough to pay us back for our outlay in planting.

The price of these lands will be advanced August first to $6.00 per acre.

REMEMBER, THE TITLE TO THESE LANDS WILL COME DIRECT FROM THE PANAMA GOVERNMENT TO THE PURCHASER.

This is worth instant investigation.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE GAIN FROM RECORD-KEEPING.

Before the results of modern herd records were known, dairy cattle were admitted to the herd-books, and bought and sold, chiefly on their outward appearances. There was no standard by which to determine the relation of form to production. A nice-looking cow was the one which brought the most money. What constituted such a cow was largely a matter of opinion or prejudice. With the introduction of herd records, opinions came to be valued in direct proportion to one's understanding of the relation of form to production. Everything must be determined in the light of the scales, the Babcock test and the cost of milk-production.

To Minnesota must be awarded a large portion of the credit for the inauguration of the newer and more rational system. For the past twenty years the milk fom every cow in the station herd has been weighed and tested morning and night; and at least twelve years ago it was found that certain cows in the herd returned $55.54 per cow, while others returned only $8.19, after deducting the cost of feed, which was the same in each case. Later, by the same means, the Michigan Experiment Station found that, after deducting cost of feed, cows returned from $6.18 to $94.05; the New Jersey Station showed, when milk was valued at $1 per hundred, a variation of from 13 cents to $49.72; and in Connecticut it was demonstrated that while the best cows returned $54.72, the poorest returned only $2.76 above the cost of feed. With such figures as these, supplemented meanwhile by similar results from the records of up-to-date individual dairymen and of test associations, it became evident that the dairyman who kept no records had but a poor show of succeeding in business in competition with the one who did. That many have taken the lesson to heart is shown by the fact that testing associations are steadily growing in numbers, and that more pure-bred sires have been introduced into Minnesota during the last three or four years than in all former years put together. A sire bred from a cow with the highest record is the most eagerly sought for the production of new herds. "Breed to the winner" seems to be the motto.

Prof. Grout points out, however, that the record is not the whole thing in determining the value of a sire. Just as the colt, which presumptively inherits "a wonderful burst of speed," may from inherited physical weakness fail to approach the record expected, so may the daughter of the most high-bred sire fail to approach in milk-production, the record of his dam.

By record-keeping and a careful weeding-out of unprofitable stock, combined with an equally careful selection of pure-bred sires, and good care, the average production of the Minnesota cow can be raised from 160 lbs. of butter to twice that amount. With a million cows, the latter figure would mean an addition to the dairy revenues of our state of from $30,000,000 to $40,000,000 a year. And the instrumentalities for attaining this result are so simple—the scales, the Babcock test and the suiting of the ration to the cow—that it seems hardly possible that many of our dairymen will be long content with any inferior system.—Condensed in part from address before the Northwestern Guernsey Breeders' Association by Prof. George P. Grout.—C. R. Barns, Extension Division, Minnesota Agricultural College.

FEEDING HORSES.

The following short hints on horse feeding, given by the Horse World, are intended not for the experienced, but in the hope that some owners who, with the best intentions, know nothing of the delicate organization of the interior economy of a horse, may be induced to pay more attention to the feeding of that useful animal, man's best friend. All probably know that a horse wants three meals a day, but are not careful of the proper interval of four to five hours between each meal. Few, for instance, know or care to know the time required for digestion,—namely, at least two hours for oats and three hours for hay—so that hay should be given in the evening when the day's work is over. The evening meal should be, of course, the most substantial, the work being over, there is ample time for rest and digestion, and for the renewal of exhausted tissue or muscle. Some horses are such shy feeders as to eat only at evening or night.

Feeding should be regular and the horse required to work as little as possible on a loaded stomach, and an interval of half an hour should elapse before food is given to a heated and tired animal. It is equally injurious to feed a horse too often, or too seldom, both being productive of the same result—namely, colic. The horse fed at too long intervals is apt to fret and knock about, eats too greedily when he gets the chance, and is apt to become a cribber. Food, then, should be given about every five hours, when the previous meal is digested, before charging the stomach again. But little food or water should be given during short stoppages, in order that both stomach and bladder may not be overcharged while at work. Most people know how a bucket of water will stop a race horse, but few think how the overcharged stomach affects the lungs of a horse when at work. A horse when fed while heated and out of breath cannot digest its food, and the result is diarrhoea, or, curiously enough, the extreme opposite in the form of colic or indigestion. Coleman's Rural.

JUDGMENT NECESSARY.

The farmer must use his judgment in balancing up rations. We have aimed to simply give the general principles. The details he must work out for himself. Suffice it to say that the cow can not do her full work if she is fed on alfalfa hay alone, for the reason there is too much flesh-forming and not enough carbohydrate material in this diet. Nor can one get the best work out of his cow on clover

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

hay alone, nor on silage alone. Bear in mind that the carbohydrate rations include all the straws, corn in every shape and form, sorghum, timothy and millet hay. Remember that the flesh-forming rations are alfalfa in any form, the clovers, bran, shorts, oil meal and cotton seed meal. If the farmer who is milking say ten cows will bear these facts in mind and will give the matter careful study, a little experience will enable him to ascertain what ration is best for his stock.

It seems to be a common impression that anyone can run a dairy, but this is a sad mistake, for it requires a business head to make a success at anything. It requires a man with tact and skill to milk properly. Cows should never be abused in any way, and should always be made comfortable. A dairyman cannot afford to have his cows neglected or abused, because it would be a direct loss to him. A cow will soon get to dislike a rough attendant. He makes her nervous and restless, and consequently she does not produce her best returns.

A dairyman should have some good, profitable cows, some that have good udders and four good teats each and that will produce over 5000 pounds of milk and 250 pounds of butter per cow per year.

Cows should be fed and milked regularly at the same hour each day. They should be well bedded and made entirely comfortable. Each cow should have the food that she relishes most and the kind that gives the best returns. Cows should be curried and kept perfectly clean, and should have salt and water at their disposal all the time. If a cow while under the above treatment does not produce more than 5000 pounds of milk and 300 pounds of butter annually, it is worth only about $30 to $40 cash. A cow making 400 pounds of butter is worth over twice as much, because a cow that makes 400 pounds of butter seldom eats any more food than one that makes 300 pounds, and it takes the same amount of care for each. Therefore, the extra 100 pounds would be clear profit. This illustrates the importance of keeping the individual records of the dairy herds.—Journal of Agriculture.

FLY REPELLANT.

A reader hands in the following recipe for making a fly repellant which is said to be effective: Resin, one and a half pounds; common soap, two cakes; fish oil, one-half pint; and water, three gallons. Dissolve the resin in one gallon of water, and the soap cut fine. When dissolved, add the fish oil and the remainder of the water. Stir thoroughly before using. Apply with syringe or brush. This is an excellent fly repellant, cheap and effective.—Kansas Farmer.

No Hoof-No Horse

Especially is the dry season in this section very hard on hoofs. If you have a horse with a bad foot caused by tender, brittle, hard or contracted hoofs, split hoofs, quarter cracks, mud fever, scratches, corns, cracked heels or grease heels, send 16 cents postage and we will send you a 50c package of ESHELMAN'S WOOL FAT HOOF HEALER, and if satisfactory, send us the 50 cents. If not, write us to that effect, and you need pay nothing. We take all the risk, you just try it. Send for it today, or send for folder with many testimonials of big horsemen, vets and others.

HOW TO MAKE SCHMIERKASE.

Cottage cheese, sometimes called Dutch cheese or schmierkase, is made from skimmilk. A small amount of buttermilk may be added. To make cheese, allow the skimmilk to become sour and curdled. Heat it then to from 90 to 100 degrees F, in about thirty minutes. After reaching the desired temperature remove the vessel from the source of heat and leave the curd in the hot whey for about fifteen minutes. Remove the whey by pouring the heated clabber into a cheesecloth bag or on a draining rack (made out of wire screen with cheesecloth spread over it) and allow to drain until no more whey appears. The higher the temperature to which the clabber is heated, or at a like temperature, the longer the time of heating and the longer the curd remains in the hot whey, the harder and dryer the cheese will be. By regulating the time and temperature we can always produce cheese of the desired consistency.

The yield is about fifteen to twenty pounds from 100 pounds of skimmilk, and the price is about ten cents per pound. Before using or selling, the curd must be worked thoroughly and some salt and cream added. The amount of salt added depends upon the taste of the consumers, two ounces to each ten pounds of cheese is a medium amount. Adding cream greatly improves the flavor of cottage cheese, and since under ordinary conditions a pound of medium rich cream testing, say, 25 to 30 per cent fat, never would be worth more than ten cents, there is no danger of losing money by adding cream to cottage cheese. One pound of cream to ten pounds of cheese is a fair ration. In a cool place cottage cheese may be kept for several days. The softer the cheese the sooner it will spoil and sour. Always use good, clean skimmilk; do not let it become too sour.—Coleman's Rural.

THE GRANGE.

It is not difficult for the student of Grange history to explain the ever increasing prosperity of the order. Founded on principles of eternal truth, with an unstained record of over forty years, during which time it has fought the battles for agriculture by doing for the farmers of our land the things they most needed done, this record of achievement should challenge the attention of all intelligent farmers and interest them in Grange work, but when we add to this the willingness of organized capital and organized labor to sacrifice the rights of the farmer, and the utter disregard of some of our so-called statesmen to rural welfare, we find it dawning on all tillers of the soil that the Grange is their only salvation. The Grange grows because its officers, state and national, are real farmers, with the welfare of their fellow toilers at heart.

If a sufficient amount of intellectual dynamite could be exploded to awaken all patrons to a full realization that "in union there is strength," and make of each a valiant Grange missionary, our order would experience such a growth that it would attract attention nation wide.—Louis J. Taber.

LICE REMEDY.

Tobacco tea has been found to be an excellent remedy for lice on dairy cattle. Its preparation and application may be made as follows:

Take a pound plug of any brand of tobacco and boil it for two or three hours in two gallons of water. Then set it off and add two gallons of fresh water. Apply this liquid to the cow affected with lice, with a heavy horse brush. This rubs the medicine well under the hair. Those who have tried this preparation say that one or two applications are enough to destroy the worst case of lice in existence. The remedy is certainly a simple one and should be tested by those who have lice on their cattle. Young stock especially may receive the treatment with beneficial results.

A SHETLAND PONY FARM FOR CALIFORNIA.

W. T. Carr, an Illinois man, has purchased 774 acres of land in California, between Nelson and Chico, to use as a Shetland pony farm. Mr. Carr will commence immediately to prepare the ranch for the blooded stock, which he will take from the East. The purchase price of the land was in the neighborhood of $50 an acre, which includes a crop of growing wheat. The Shetland pony industry will be a comparatively new one to California. Heretofore this class of animals has been purchased in the East. The demand has been so great of recent years that Mr. Carr decided to establish a farm in California. After looking carefully over the state, he chose the land near Chico as the most suitable place.—Horse World.

The downward trend of pork prices has given rise to the belief on the part of some that lower prices may be expected this fall. No one can predict with certainty, but even if prices should fall lower than they now are it is very doubtful if any farmer can afford to continue his operations without hogs. What he needs to do, however, is to study ways and means by which pork production can be cheapened, and this is just as good a way to increase profits as is the securing of higher prices. The pig is about the only animal on which the farmer does not have to pay taxes. He comes into the world after the tax assessor has made his rounds, and is put on the market before he appears again. With plenty of good pasture, especially if it be alfalfa or clover, the farmer is in a position to reduce the cost of his pork production and still clean up a little profit in spite of lowering prices. —Kansas Farmer.

The calf that is to be raised on skim milk should be taught to eat grain early. When they have access to it, many of them begin eating grain at two weeks of age, or three at the latest. The grain should be placed in a box where they can easily get to it and they can be encouraged at first by placing a little in their mouths after they have consumed their milk. Grain can best be fed dry after the milk is fed. In no case should it be fed in the milk, as in that case it will be gulped down without chewing, which is bad for the digestion. After a calf begins to eat considerable, grain should not be kept before it. No more should be given than will be eaten up twice each day, which will not be over one-half pound daily for the first two months. After this they may have more, but it will not be necessary to feed more than one pound per day up to six months unless it is desired to push them rapidly.

Over 130 cars of early grapes will be shipped from the Imperial Valley.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

Bees and Their Care

AMONG "AMATEUR" BEE KEEPERS

By J. G. Gilstrap.

We all make mistakes or have made them. Some years ago, about twenty, I was learning some of the ins and outs of modern beekeeping in Kings County, and had learned something of the different races of bees. Talking with a very egotistical man one day I alluded to the different races of bees and he very quickly informed me that there were but two races of honey bees, i. e., the common wild bee and the big black Italian bee; and if there were any others they were only crosses of these two parent stocks.

An acquaintance bee keeper was passing a farm house in this valley a few years ago when he was hailed by the owner of the place, who, by the way, was a horticultural commissioner of no mean repute, and the bee man was asked to stop and examine his bees, a few hives sitting in the yard. The owner said he thought they were diseased, foul brood or something, he knew not what. Taking the bee man to the affected hives he was shown several brood combs that were well supplied with pollen or bee bread. The joke was certainly on the horticultural commissioner.

Last year I was inspector of apiaries of Stanislaus county when I drove up where a couple of German boys lived who had the nucleus of an apiary. They had been raised in the large cities and had never seen bees till they purchased this place, a short time before my visit. As we looked through their bees they were eager for information in all lines of bee lore. Finally one of them asked me what that was in the combs that looked like worms. I told him they were the larvae, young brood not hatched. He burst into laughter saying the joke was on them. A few evenings before they had opened a hive and seen those worms. They thought they were maggots and they carried the combs to the house and picked out several hundred maggots.

A young man working on a farm near Modesto last year who had never looked into a bee hive before had been asked to see if he could get some honey out of the hives. He proceeded in the attempt and when three days later, as I came by the place to inspect the bees, the same young man took me to the hive and said he had taken a little honey from the one hive, but they had but little. He said that he cut out all the old comb that didn't have honey in it. Well, imagine my surprise to find six or seven combs of brood, all they had had, out on the ground and the empty frames in the hives. He thought those combs useless.

STARTING AN APIARY WITH SMALL MEANS.

By W. H. Allen, Santa Paula, Before the State Bee Keepers Convention.

My subject is, "How can a man with small means start in the bee business." I hear some say, "It can't be done." I say it can. I have done it and what I have done, others can do, if they follow my instructions.

In the first place I will ask you to strain your credit to buy one hundred hives. I will not say what kind, as every one has his choice. I should get the Ventura Standard—this is a nine-frame hive and can be bought at the factory for $1.35, and consists of two bodies, one bottom board, one top and seventeen frames, Langstroth length. You get these in the flat and can nail them together yourself on rainy days. You see your hives will cost you $135; but I am going to ask you to get a little further in debt. It will take 112½ pounds of foundation to fill your frames. The foundation will cost you about 45 cents a pound and this will make your hives cost you $1.85 apiece or $185.62½ for the hundred hives.

Place hives where you want them to stand—be sure to have them perfectly level sideways and lengthways. Have the back about one inch the highest. This gives the bees a better chance to clean the hive and keeps the rain from running in at the front.

You now have the hives and we will go after the bees to fill them. Get some boxes about the size of, or a little larger than a single beehive. The more boxes the better, and the sooner you will get your hives filled. Be sure there are no holes or cracks in the boxes, except for the bees to go in, for they like a tight hive and will spend a lot of time glueing up a hole or crack, that they ought to put in at something else.

Now take your boxes up some of the many canyons that we find in California, set them up in a tree or on a cliff or rock and when you find a big live oak tree don't hesitate to put several in it. I have taken five out of the same tree several times. If you have a friend in the valley who will let you put some in his apricot orchard, they will be certain to catch bees, and be sure to have boxes out by the first of March.

You should find bees in some of the boxes by the middle of March; stop up the box so the bees cannot get out and put another box in place of the one you have the bees in. Always take empty boxes with you.

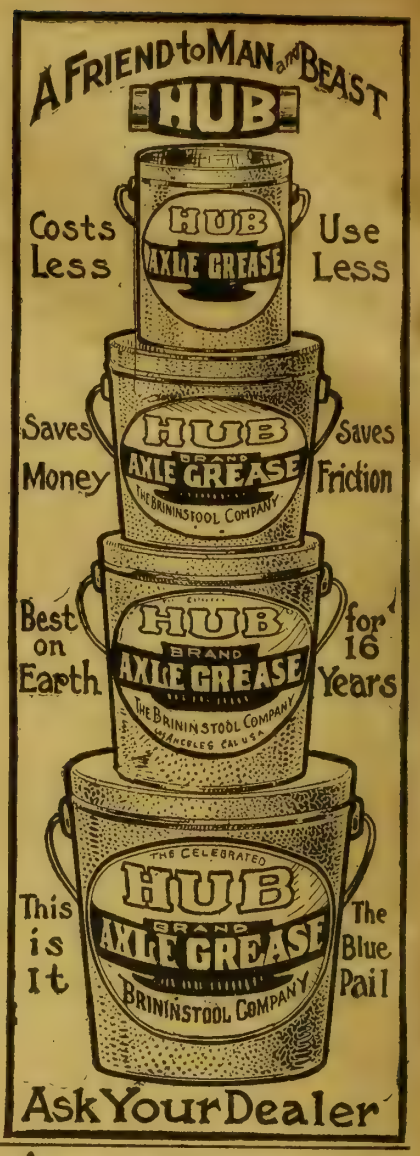
When you have been to all your boxes, take those with bees to the hives. Open a box and dump the bees in front of a hive and see the little fellows scamper in the hive and go to work on the foundation.

After the fifteenth of March you should go to the boxes once a week and you will always find bees in some of them. Go often so they will not have time to build much comb in the box. Now if you put out fifty boxes and look after them regularly until the last of May, if you don't have enough bees to fill your hundred hives, I will be fooled.

I have caught over one hundred swarms in a season and only had out about 25 boxes. I always kept extra empty boxes with me to put in place of the ones I brought home.

Now you have your hives full of bees and must find some way to pay for the hives. Some of the first swarms you have caught will be very large and in a short time they will have all their combs drawn out and filled with brood and honey and ready for a super.

My plan has been to use my regular super put in section holders and fill with sections. It will hold 56 sections, two deep. I have had swarms I brought from the trees make two of these supers full, 112 pounds, while some of the smaller swarms did not make anything at all, but I think you would be sure to get two tons of comb honey from your hundred hives. You can sell for ten cents a pound. I have always received 12½ cents or 15 cents for mine; but say ten cents, there will be $400, enough to pay expenses and have something left and your bees will be worth at least $400.



STAR PORTABLE DRILLING MACHINES

Drillers

Know best why they prefer a certain machine to any other make—it's not merely a notion. They want the one that will ***make the most hole*** in the shortest time, and with the least amount of trouble. They're exactly right.

Star Portable Drilling Machines

are conceded the standard for all Well Work, because of their construction, which guarantees them Economic, Speedy, Simple, Durable—the drillers' favorite.

General Agriculture

HIGHWAY BUILDING AND MAINTENANCE.

Maintenance of highways is the vital essential which accompanies the improvement of roads, which fact the National Good Roads Board of the American Automobile Association desires to impress upon the highway authorities of the entire country. There is nothing new in the proposition except that its thorough comprehension will save thousands of dollars to those states which come to an immediate realization of the fact before proceeding with the expenditure of the millions of dollars recently appropriated by many legislatures.

France is looked upon as a nation of road builders, and its highway system has long been considered a model to be followed by other countries, hence the National Good Roads Board has been lately devoting much attention to the situation there, brought about by the increased volume of road traffic caused by the advent of the automobile. No man has toured over more miles of European roads than Francis Miltoun Mansfield, the American consul at Toulon, who is now on a leave of absence in this country.

"That French roads are the best, taking them collectively," asserts Mr. Mansfield, "there is no doubt. But it is true that these highways are not standing up to the new travel conditions in regions where there is an abnormal increase over the slow-going horse-drawn traffic period. An appropriation hitherto spread over a stretch of road traveled by a hundred vehicles a day will not suffice that which is used by five hundred, even though four hundred be of the rubber-shod variety and do not of themselves tear up the roads. Narrow iron tires and the caulks of horseshoes together work the damage, and until new systems of road building can be inaugurated there must be an exceedingly intelligent distribution of expenditure so as to deal with the question of upkeep at busy corners, both in town and country, so that there will not be a shortage and the surface will be in a normally good condition continuously.

"The good roads question in France is national, dependent entirely upon the making or remaking of national highways of the first, second or third class, and it is to be noted that a route nationale in France is still a national road, and its upkeep is at the charge of the nation, even though it ambles for miles through the heart of some busy city like Lyons or Marseilles. The roads question, then, is one dealing with roads, and not streets, and in this connection, though one-third of all the registration of motor vehicles in France is confined to Paris and the neighboring communes, fifty odd thousand automobiles running up and down the main roads of France make this national care of roads a necessity, as is the national policing of the open country. Nothing in that paternal land is left to local control where the public good of the entire population is concerned.

"This is the French policy, and the pattern upon which all other national road building governments of the Old World are founded. Italy, less consistent in its policy, works on the same lines, and fails only when the local officials of a province are not up to the standard of efficiency of their neighbors. Such a state of affairs in France is hardly conceivable. Take the case of a new country like Algeria and Tunisia, as French as France itself, though the Mediterranean separates them from the mother country. Here the national spirit prevails, and the national roads are good roads. This is so even in Madagascar. French again!

"To come nearer home, or at least nearer to our understanding, roads control in England produces results quite analogous to those in our own country, except that when all is said and done the upkeep of England's roads is, at its best, of superlative excellence. They, with comparatively short stretches to deal with, likewise a circumscribed area, find this thing possible where another more unwieldy prospect could not thus be handled. New York and Pennsylvania, with an automobile registration in excess of 100,000, show double the number of motor vehicles of France, while their combined area is approximately the same. Again, referring to conditions in England, the famous Bath road from London to the celebrated spa, over which rolled the stage coaches of the days of Beau Brummel, a distance of 112 miles, is under the jurisdiction of sixteen separate corporations. As to surface it is a thoroughly good road, but each bailiwick seemingly has its own ideas as to methods, and thus it is that the cost of road building varies greatly, not only in the amount of the bill rendered, but in actual durability of results, and now Britain is asking for a national plan of maintenance.

"We in America have much to learn. We should build for all time, and we should build intelligently, neither sparing reasonable exepnse at the outset nor neglecting the very important question of upkeep, once we have laid down the general lines. We, too, are a new country, and if a wilderness like Algeria can be made to blossom with good roads, it is not impossible for Virginia and Arizona to do the same."

PLANT FLAX.

Some years ago, in southern and central Minnesota, flax was grown in such abundance as to make this state the foremost in the Union in the production of seed. The crop was a very profitable one, too. But the "wilt" appeared; the land became, as it was said, "flax-sick;" and all attempts to cultivate it longer brought such disappointments that flax was reluctantly wiped from the list of the farmers' available resources. The same experience was repeated in other parts of the state as their lands were successively devoted to flax.

But experience has demonstrated that in from five to seven years the "wilt" disappears from the soil it has infected, and that then it can be again planted with flax, with the assurance of a crop as good—other conditions being equal—as in "old times." The price of seed is now so high, and the demand so large, that the farmer who prior to 1904 raised flax with profit can now very profitably again devote a portion of his land to it. In European countries, the "wilt" is circumvented, and a regular supply of flax insured, by giving that crop a place in a seven-year rotation. Under such a system the crop is as certain as any other. The plan may well commend itself to the consideration of farmers.—C. R. Barns, Minnesota University Farm.

Killefer Riding and Walking

BEET PLOWS

Killefer Walking Beet Plow

This is the strongest plow on the market. Can be had with straight or offset standard, and has one piece land side. Nothing but hard plow steel is used in the Standard Shin Landside and point. Point and Shin are reversible. We guarantee this plow to do satisfactory work in any beet section.

Two Row Riding Beet Plow

It is especially adapted to large acreage, as it does double the work of single plows with but little more draft, and leaves the ground in fine condition for hauling off beets, as it does not throw up large clods.

The Standard Shin Landside Point and wings are made of very hard steel, which we have rolled for this work, and extras are always on hand for immediate shipment.

Both plows can be had with or without steering device. Write or call on us direct if your dealer does not have these tools.

Killefer Mfg. Co.

2210 Santa Fe Ave., Los Angeles

Our Monarch Cultivator is the Strongest Chisel Tooth Cultivator on the Market. Excellent for Bean or Beet Culture.

Tell us your troubles. We make special tools to order for handling special work.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

CONTENTS THIS WEEK

THE SWEETEST LITTLE COUNTY IN THE STATE, Cover.

BROWN SPOT OF NAVEL ORANGES, 51.

CITRUS AND TROPICAL FRUITS.—Russeting of Fruits; New Mango; 52, 53.

DECIDUOUS FRUIT CULTURE.—Aphis and the State Law; Pollination of Orchard Fruits; Black Peach Aphis; 54, 55.

LIVE STOCK AND DAIRY.—Gain from Record Keeping; Feeding Horses; Judgment Necessary; Fly Repellant; Schmierkase; The Grange; Lice Remedy; Shetland Pony Farm; 56, 57.

BEES AND THEIR CARE.—Amateur Bee Keepers; Starting an Apiary with Small Means; 58.

GENERAL AGRICULTURE. — Highway Building and Maintenance; Plant Flax; 59.

EDITORIAL.—Alfalfa Weevil; Neighborhood Experiment Stations; Made the Best of an Evil; Reorganizing; Short Courses; Problem of the Child; Editorial Notes; 60.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST. — Northern, Central, Southern, The Coast; 61.

PROFIT IN THE POULTRY YARD.—Good Market Eggs; Age of Fowls; Catch Chicken Thieves; Buying Stock and Eggs; Lice on Turkeys; Feeding Coops; Rhode Island Reds; 62, 63.

IRRIGATION AND FORESTRY.—When the Pump Pumps Air; Transformations of Water; 64.

QUESTIONS AND ANSWERS.—Peaches Not Bearing; Preparing Land for Potatoes; Sweet Pickles; Green Geese; Asparagus Tops; Tomatoes Dropping; Questions of a Beginner; Aphis; Ants on Rhubarb; Topping Eucalyptus; Blight; Guavas Not Bearing; 65, 66.

HOUSEHOLD.—The Fitness of Things; Will 300 Chickens Support a Family; Conundrums; Homely Hints; Fly Poisons; 68, 69.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 70, 71.

ALFALFA WEEVIL.

In the issue of The Cultivator of February 16th appeared an article on the alfalfa weevil, calling attention to the energetic work and the quarantine regulations of the commissioner of horticulture of Arizona. Since then the California horticultural commissioner has taken up the matter very energetically and has instructed the quarantine guardians of the state to keep closest watch for this pest, especially along the lines of travel from Utah. So far the ravages of the weevil have been confined to a comparatively small section of that state, but every month the area grows, and more than 100 square miles has been added to the infested section during the last few months. Commissioner Jeffrey has written to the quarantine officers:

"I wish to call your attention to the danger of allowing it to become established in this state and the necessity of keeping a careful lookout in this respect along the railroad tracks on any alfalfa plants that may be growing there or in the fields adjoining, for signs of this pest.

"This is one of the hardest insects to quarantine against, as it would rarely be imported in seed and would be in the adult or pupal forms. It is, however, necessary to inspect seed carefully for any stray pupa or adult.

"It spreads in the adult form chiefly through being carried on railroad trains and any other convenient means of transportation.

"We should by no means allow alfalfa hay to come in from Utah. Our fields must be carefully watched for signs of this insect, and any beetle of a suspicious nature should be sent to the State Insectary, Capitol Park, Sacramento, at once for identification."

The next issue of The Cultivator will give extended quotations from the latest government bulletin on this subject, with illustrations of the pest.

NEIGHBORHOOD EXPERIMENT STATIONS.

In his address before the Claremont Pomological Club at Pomona Saturday, Prof. C. B. Lipman made a strong point of self reliance on the part of the fruit grower and the conducting of a series of experiments to inform himself as to conditions and requirements of his own soil. The university is receiving every day requests for information as to specific cases; in fact, we may say that to this office queries come every day as to methods of fertilizing particular crops on certain soils in a certain section. To answer such questions with any degree of exactness is impossible. Even after applying soil analysis, there are other factors to be taken into consideration which should govern the handling of a certain soil for a certain crop. Prof. Lipman's suggestion was that a corner of an orchard be set aside and that certain methods of manuring and applying complete commercial fertilizer be followed, not only one year, but for a period of years. Nothing is to be lost by such experimental work and a very valuable lesson may be gained.

More extended reference to Prof. Lipman's talk will be given in next week's paper.

MADE THE BEST OF AN EVIL.

On another page is an article on ridding the orange groves of Florida of the rust mite. We quote this from a Florida paper because of the fact that the time was, and still is with a few, when the so-called "russet" orange of Florida was considered the sweetest orange grown. A question recently came to the Cultivator as to whether the "russet" orange could be secured and planted in California.

The rust caused by these little insects was at the very first thought to be objectionable, but someone, doubtless an ingenious Yankee, who had gone to Florida to raise oranges, thought of the idea of claiming superiority for these defective fruits. This succeeded so well that for a time "russets" commanded increased prices. The fad is now past and the question is how to rid the trees of the pest.

REORGANIZING.

State Horticultural Commissioner Jeffrey has made several material changes in the personnel of his office. Mr. Stephen Strong, formerly deputy county horticultural commissioner of Los Angeles county, has been made quarantine guardian in charge of Southern California. Mr. Strong will personally watch the introduction of plants and fruits at the port of San Pedro, and another guardian under him will have charge of the port of San Diego. Mr. Strong will have direction of the county horticultural commissioners acting as state quarantine guardians by virtue of their offices.

Another change in the state office is the transferring of Mr. O. E. Bremner, formerly secretary of the commissioner, to the office of chief quarantine officer at the port of San Francisco. This is the office formerly filled by Mr. Dudley Moulton, who has retired.

SHORT COURSES.

The University of California is sending out announcements for the farmer's short courses for 1911. These begin with a general agricultural course of two weeks on October 2nd; also on the same date with dairy manufacture and poultry husbandry. Others to follow are rural education, household economics, dairy farming, animal industry, veterinary science, horticulture, viticulture and entomology. Circular No. 64, giving particulars as to the courses, may be had by addressing Principal, University Farm School, Davis. Railways will give reduced rates to attendants at the school.

PROBLEM OF THE CHILD.

"The Moral Problem of the Child" is the name of a booklet written by Mrs. Woodallen Chapman. It is a small 25 cent book dealing with the best method of informing children of those things in their lives which are kept from them, often to their injury. It may be had by addressing the author at 651 West 179th street, New York.

The Bureau of Soils of the Department of Agriculture reports that several hundred samples of soils are received annually. The bureau has from its soil service fairly complete information of most sections of the United States, and especially of California, and can give explicit information. It is seldom that the samples are given complete analysis. We doubt not much information may be had by keeping in touch with this valuable factor in the department.

Commissioner Beers of Santa Barbara County reports the cherry crop of the Lompoc Valley as being exceedingly heavy this year. He says, "The trees are a mass of delicious fruit, very large, finely ripened and of delicious quality."

Without doubt there will be a fierce fight on the present lemon tariff. Importers have supplied from their own pockets and those of the Italian lemon growers an immense fund to try and batter down the cent and a half protection. They are appealing to the prejudice of the East through high prices which have "deprived sick women and children" of the healthful lemon during the fearful heat of the last few weeks. If California is to produce lemons to supply those who see fit to live in the sweltering East, there must be some little encouragement to put the industry on its feet. The high prices which have been obtained for California lemons during the heated spell are the result of shortage of supply. If encouragement can be given to increase this supply to meet the needs of the nation, there will be less suffering on the part of those whom the importers are trying to use to create sympathy against the lemon grower.

Honey producers are pleased at the year's flow, which is even better than anticipated early in the season, and the prices are satisfactory. Mr. Mendleson, of Ventura county, reports from the Colorado association that the crop of that section will be very short. Mr. Shaffner, secretary of the California Bee Keepers' Association, reports the general prices prevailing at this writing: water white 8 cents, white 7½ cents, light amber 7 cents. The Andrews apiaries at Corona report a possible output of forty tons. It is to be hoped magnificent returns will be secured by California apiarists this year to make up in part for the losses of last season.

The next session of the Dry Farming Congress, which will be held at Colorado Springs October 16 to 20, will discuss one proposition which should lead to more than discussion. That question is the harmonizing of agricultural laws in the various states. The unification and simplification of all these laws will certainly lead to the advancement of agriculture. A committee is to be named which will endeavor to accomplish some progress which it will report before the next meeting of the congress.

The Crop Reporting Board sent out information the first of July that the general condition of crops was very satisfactory, for example, cotton showed 88.2 per cent of normal. This was better than on the same date in 1910. Corn at that time was likewise in a satisfactory condition, but general report has it that the drouth and heat of the past few days have materially lowered the crop conditions.

A complete report of last spring's demonstration train campaign shows that over 76,236 California farmers attended the lectures. This was a material increase over the preceding year. The mileage covered was 4000. The train was out seventy-six days and held 225 meetings. While the same towns were visited as the preceding two years, the increase was pronounced.

Despatches in the daily papers chronicle the sale of the Jersey bull Noble of Oaklands at a sale at Coopersburg, Pa., for $15,000. This is declared to be the highest price ever paid for a single Jersey. The cow which produced this animal also sold for the long price of $7000.

Heavy rains have greatly injured the bean crop near Lewiston, Idaho.

Agricultural News Notes of the Pacific Coast

Northern California

Cherry picking is finished in Sonoma County.

Sheep inspectors of Sutter County report no scabies within its boundaries.

At the Ukiah wool sale, a few small lots changed hands on a 15 to 16 cent basis.

The comys fusca is doing good work on brown apricot scale of Sonoma County.

The Gravenstein Apple Show at Sebastopol will be held this year, August 14 to 19.

Owing to the cool season, hops are reported much more backward than last year.

Ukiah claims a $50,000 egg output. The poultry association there has a membership of thirty.

One of the premiums at the coming State Fair will be $250 in gold for the best gasoline traction engine.

A great many caprifigs containing blastophaga are being distributed from the Maslin orchard at Loomis, Placer County.

Yolo, Colusa, Glenn and Tehama Counties are planning to combine to make an exhibit at the Panama-Pacific Exposition.

Sutter County will plant more extensively of Thompson Seedless grapes another season than for several years.

"No Johnson grass allowed to go to seed in this county," is the slogan of Horticultural Commissioner Galloway of Sonoma.

Fruit growers of Vacaville are hoping to replace Japanese labor with Mexican, which they are finding more satisfactory.

Secretary Andreason announces that the dairies of the state must clean up and conform to the provisions of the Martinelli dairy law.

F. H. Bolster, formerly in charge of Gardena agricultural high school, will teach botany at the State University Farm this year.

Thirty acres of standing grain, two stacks, a header and other valuable property was destroyed by a field fire at Oroville, Butte County last week.

The management of the State Fair, which is to be held in Sacramento August 26 to September 2, announces the biggest and best state fair ever in the state.

County Horticultural Commissioner Galloway of Sonoma County says that but very few eggs of the codling moth have been observed during the last few weeks.

The Sutter Almond Growers Association recently held a meeting at Yuba City, at which Manager Dargitz of the California Almond Growers Exchange made an address.

The wool sale recently announced for Cloverdale, Sonoma County, was called off because of the few offerings occasioned by the low prices offered. Fourteen and fifteen cents did not look good to the producers.

Articles of incorporation of the Santa Rosa Pultry Association and Egg Exchange have been filed at Santa Rosa. The incorporators are John J. Fitzgerald, Max Fischer, Andrew McDonald, H. J. Wright and W. E. Pietsch, the latter of Oakland.

Central California

Dinuba is now forwarding eight cars of watermelons daily.

Raisin growers are holding for 4½ to 5 cents for the new crop.

A German potato grower cleared over $200 from one half acre.

Farmers at Madera are developing much water for irrigation by pumping.

The cannery at Hanford, Kings County, started on peaches July 10th.

Fresno County is delivering standard varieties of peaches to the canners.

Potato growers over the valley are elated over the present condition of the market.

Portions of Tulare County are infested with what is called the Arizona thistle.

Porterville reports oranges rapidly sizing and that the usual June drop did not occur.

Dinuba, Tulare County, claims to be the banner watermelon producing section of the state.

Exeter has forwarded sixteen cars of deciduous fruits; some of them topped the market.

Contracts have been signed for the construction of a packing house at Worth, near Porterville.

Lindcove, Tulare County, has already had a serious field fire, over 400 acres being burned over.

The squirrel inspector of Kings County reports a good showing on squirrel eradication work.

Pajaro Valley apple growers are still discussing a more desirable co-operative marketing organization.

The state veterinarian recently delivered an address to the dairymen of Visalia on tuberculin testing.

The Watsonville Poultry Association is making an exhibit at the Santa Cruz show, which is on this week.

A Portuguese dairyman near Goshen has been on the carpet and paid a $15 fine because of uncleanly conditions.

Agents of the Department of Agriculture are making investigations as to irrigation pumping plants of Fresno County.

A farmer at Visalia recently lost his life by his clothes being caught in a barbed wire fence while he was fighting a field fire.

The gauge on the Kings River near Red Mountain showed the maximum flow of the river on June 18 to be 23,282 second-feet.

A pest of grasshoppers near Hanford is claimed to have been wiped out by flocks of millions of blackbirds which feasted upon them.

The new crop of dried apricots is being delivered, and Fresno reports the shortage so great that but very few car lots will be sent out.

The cool weather which has prevailed most of the season is responsible for the slow ripening of fruit and Madera reports crops more than ten days later than last year.

A mass meeting was held at Stockton recently to discuss the matter of securing an appropriation of $100,000 for the opening of Mokelumne River for navigation between Taison and Woodbridge.

Southern California

A freak shower fell in certain parts of Southern California last week.

County Bee Inspector Wagner of Imperial reports a fine flow of honey.

An abundance of water for irrigation has been found in wells at Fallbrook.

The Escondido Poultry Association will hold its first annual show December 6-8.

Southern California Arboricultural Association held a meeting at Pomona last week.

Two orange packing houses were burned at Arlington, Riverside County, last week.

The Lemon Men's Club of Southern California held a session in San Dimas last week.

Grape growers of San Diego County are exasperated at the destruction by rabbits and quail.

The walnut crop at Garden Grove, Orange County, has shown but little blight, and the output promises big.

The meeting of Lima Bean Growers at Ventura last Saturday resulted in adding over 40,000 bags to the pool.

The Corona Foothill Lemon Company, recently incorporated for $300,000, has elected S. B. Hampton president.

An expert of the Department of Agriculture is investigating the squirrel situation at Santa Maria, Santa Barbara County.

The Lima Bean Growers Association of Ventura County estimates that there are only in hand about 35,000 bags hold over beans.

Huntington Beach sugar beet growers celebrated the Fourth of July by the dedication of the great sugar factory just constructed there.

The citrus fruits of Pomona, Los Angeles County, brought to that rich section in excess of four million dollars for its 4,500 cars of fruit.

The shipments of cantaloupes from the Imperial Valley considerably exceed the 2,500 car mark which was the estimate of the earlier season.

Escondido, San Diego County, which is becoming famous for its table grapes, finds the season will be much more backward than last year.

The cannery at Hemet, Riverside County, began operations last week turning out 15,000 cans daily. The cannery will handle 500 tons of cots.

The Imperial Valley has never been considered especially strong on watermelons, but one firm at Brawley has shipped fifty cars of fourteen tons each.

The Oxnard sugar factory's campaign began on Monday, July 17th. Extensive improvements have been made in both the factory and the beet dumps.

A consignment of Mexican mangoes was destroyed at the port of San Diego by the State Horticultural Deputy Commissioner because they showed evidence of being worm infested.

The law enacted by the last legislature preventing the destroying of rabbits by "rabbit drives" has compelled orchardists of Escondido, San Diego County, to construct thousands of feet of rabbit proof fencing.

The Coast

Springfield, Oregon, is calling for rain.

Eggs at Tacoma, Washington, are selling at 24 cents.

A fruit fair is being planned for Coeur d'Alene, Idaho.

Timothy hay is practically all cut at Outlook, Washington.

The census shows Idaho's hogs to average in value $10.50.

Apricots are beginning ripening at Wenatchee, Washington.

The Spokane Valley is beginning the harvesting of winter wheat.

The earliest ripening wheat is being harvested at the Dalles, Oregon.

The first car of apples out of North Yakima, Washington, was shipped on July 8.

The watermelon crop near Kennewick, Washington, promises to be immense.

Farmers near Lamona, Washington, are making a fight against "Jim Hill" mustard.

A forestry station is being established at Zamboanga, Mindanao, Philippine Islands.

---y producers at Cashmere, Washington, suffered heavy losses because of rains about the end of June.

A piece of ambergris worth over $150,000 was recently taken from a whale killed near Victoria, B. C.

Spokane, Wash., depends upon California for its early potatoes, two cars being received one day recently.

Sixty thousand head of sheep are being pastured in the Columbia forest near the White Salmon country, Washington.

Late rains of the Northwest have given assurance that there will be no such loss from forest fires as obtained last fall.

Nearly 500,000 pounds of wool were offered at the sale at Baker, Oregon, July 8. The price obtained was about 15 cents.

Wheat ranchers at Pullman, Washington, do not think they will begin the harvesting of winter wheat until August 1.

Forty thousand acres of land near Moses Lake, Eastern Washington, will soon be placed under the ditch and given over to fruit culture.

Drainage District No. 1 in Klickitat County, Washington, will construct a canal for draining and reclaiming its lands. It will cost about $85,000.

The Y. M. C. A. of Portland, Oregon, is holding an exhibit of garden truck produced by boys who are studying agriculture under that institution.

Phoenix, Ariz., was given a heavy rain storm July 1. It was reported to be the heaviest ever fallen in that section since the establishment of the Weather Bureau.

The British Columbia Fruit Growers Association, which will meet in Victoria in August, will be addressed on irrigation by Prof. Etchervery of the California University.

Melon growers at Clinton, Colo., have found that pruning of cantaloupe vines has aided in forcing earlier ripening. Some growers maintain that the time is shortened two weeks.

Pacific Egg Food

Makes hens lay; none better.
Good for molting time, too.

Special prices: 90 lb. sack, $1.75; 75 lb. sack, $1.50; ton, $37.50

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

GOOD MARKET EGGS.

There is a growing sentiment among some farmers and egg buyers for the production of better eggs for the market. The buyers demand better eggs than they have been receiving, and some farmers desire a better price for their good eggs. To produce these better eggs, the farmer should have a thorough knowledge of conditions that may affect production. The egg is manufactured by the hen from the food that is consumed, hence her feeding should be carefully considered.

No ration should be made up wholly of grain, but it should contain with the grain a mixture of bran, shorts and beef scraps or skim milk. The grain should be fed in a deep litter to induce exercise. Green food of some kind, grit and oyster shells should always be handy for the fowls. The number of eggs produced will depend largely on the breed used, the ration fed, the congeniality of surroundings, and the care given. If any of these things mentioned be omitted, the number of eggs produced will be decreased. A male bird is not necessary for the production of eggs, hence should be removed from the flock at the end of each breeding season, in order to insure infertile eggs. Infertile eggs keep better and are very desirable upon the market.

Farmers should look well to their flocks when considering the question of egg production, and select large hens of the breed which they keep, culling out and disposing of all undersized birds. By this means they will be able to obtain eggs of desirable size.

All people do not agree on the definition of a good egg, and even some do not realize the conditions that sometimes affect its quality. In order to meet any demand for first class eggs, the eggs should weigh one and one-half pounds to the dozen, be uniform in size, naturally clean, not washed, strong shelled, and fresh.

A fresh egg is one that was laid by a healthy hen, is only a few days old, and has been kept in desirable surroundings. A fresh egg is not one that was allowed to stay in the nest for a day or two, until it became convenient to gather it, or was taken from a stolen nest or an incubator, or from under a setting hen.

Age causes an egg to become stale and shrunken, and it can never be classed as a fresh egg. Heat seriously affects the quality of eggs, and in warm weather they should be gathered daily, and marketed as often as possible. Moisture causes molds to develop and quickly changes the quality of the egg. Muddy weather means dirty nests, consequently dirty eggs. Nests built on the walls of barns and hen houses are often used as roosting places, causing filth to accumulate, resulting in dirty eggs. Dirty eggs must be handled as second grades; washed eggs are just as bad. Eggs deteriorate in quality if they are left behind the kitchen stove or are stored in damp or musty cellars.

It is not desirable to keep eggs any length of time before marketing, although it sometimes becomes necessary to do so. When it is necessary to keep eggs, a cool, dry cellar should be used, and the eggs should be kept in some receptacle, such as an egg case, that will prevent them becoming broken or stained. Such eggs should be marketed as soon as possible. Only eggs that are properly handled can be accepted by egg buyers as first class stock.—A. G. Philips, Purdue University.

TO JUDGE AGE OF FOWLS.

In the case of a pullet, the surface under the wings will always be found interspersed with minute rose colored veins, which are totally absent in birds that are more than twelve months old. Again, there will be found, with pullets, a fair supply of long, silky hairs, which disappear directly the first moult is concluded. In the adult hen the skin will be found to be perfectly white, and free from either veins or hairs; hence it is easy, at a single glance, to estimate correctly whether a bird is under or over the age that acts as a line of demarcation between juvenile and adult stock. Additional evidence is forthcoming in the formation of the pelvic bones, which in a pullet are much closer than in the hen that has passed the pullet age. At two years they are much wider than at one year, so that birds at this age can be readily distinguished from those of say fifteen and eighteen months. The third point of difference is observable in the shanks and claws. In the young bird the skin of the claw is supple, and the scales are thin and brilliant. The skin gets coarser and harder as the bird grows, and the nail of the first toe, which does most of the work, gets much worn. There is also a difference in the eyelids. These acquire wrinkles as the bird gets older, and there is also a slightly shrivelled look on the face. This, with age, becomes more and more pronounced. Lastly, there is the question of wing feathers—the most infallible test of all. At the conclusion of the first complete moult, which takes place when the fowl is exactly twelve months old, the secondaries alter in shape, and bear indisputable evidence as to the dividing line having been crossed. Although the surest test of all, this latter can only be ascertained by those well versed in handling feathered stock.—Farmer and Grazier.

TO CATCH CHICKEN THIEVES.

We have occasionally lost chickens through rat depredations, and we have to keep up a continuous warfare on the rat tribe, and can manage to keep this pest in check, although never to keep them exterminated, since kind neighbors who breed rats for free distribution are always ready to furnish us a new supply when we think ours has entirely run out. Perhaps it is easier to guard our fowls from being carried off by two legged marauders than to guard young chickens, or more largely our poultry feeds, etc., from rat depredations. Perhaps a good watch dog or two will keep human chicken thieves away, just as a really good cat will keep the premises free from rats and mice, or even better. But it costs to feed dogs, and often

they are a nuisance on the premises and in the neighborhood. A burglar alarm is cheap, and usually very effective, at least if properly connected by means of underground wires with a bell in the bedroom. One of our neighbors recently caught one of those professional night operators in his chicken house one dark night and landed him safely behind the iron bars. This chicken thief was not given another chance to be out nights for the best part of a year, but was given free board and lodging during that time. The burglar alarm is a good thing. Thieves may poison or otherwise silence a watch dog. If the wires are properly placed, the unwelcome visitor cannot silence the burglar alarm. —Ex.

BUYING STOCK AND EGGS.

There is too much indiscrimination in purchasing either stock or eggs unless one has a specific purpose in view. The amateur, generally carried away by enthusiasm to outdo the other fellow or make a phenomenal success the first year, will defeat the very object he has in view by random buying. There is no excuse for this with all the state experimental stations and poultry journals at his disposal, which, if he would consult them, serve as bureaus of information in any branch of the poultry business in which he wishes to embark.

Now suppose a man wishes to go in for broilers. He must have his eyes on a heavy breed which produces an ideal carcass; if for eggs for market, a lighter breed would have to be selected and the market as to color of eggs consulted, and if for the show room any breed that strikes his fancy will do. Generally a comparatively new breed would be better, and grow up with it, as it is hard to compete with the old breeders who have been at it for years. In either case the breed must be thoroughbred. But how to get there is the rub, for the reasons that there are so many unscrupulous "jobbers" in the business who have never raised a bird, yet advertise themselves as breeders and date their career as far back as the Revolutionary war. They buy and sell eggs and stock for what there is in it. Greed is placed above principle. A neighbor got bit a few weeks ago. Two fertile eggs out of 50 eggs and not a chick. Beware of them.

If the amateur happens to live near an honest breeder or knows of one, the problem is solved. He can buy of him and study his ways and all will be right. The trade is full of sharks. I know of one in our neighborhood who lost half of his stock by roup, and is still at the old stand, selling eggs and stock. I know of another breeder who advertises his stock as prize winners. No sensible man would buy of him if he saw the unsanitary conditions and uncongenial environments which surround his yards.—The Feather.

TO KILL LICE ON TURKEYS.

The selection of proper remedies for poultry diseases and troubles will always be an important problem in poultry-raising. A subscriber in Indiana asks for information about dipping young turkeys in a solution of some of the lice-destroying compounds. My experience along that line was disastrous. We tried several kinds and strengths with the result that the young turks invariably expired soon after the lice. We decided that young turkeys were too valuable to waste in dipping experiments, so we quit dipping.

About four good dustings with Persian insect powder, or buhach, as some call it, generally settled the lice question. The powder was applied three days apart, and the job was thoroughly done. We would pour a lot of the powder on a newspaper, and while one held the bird another rubbed the powder well in among the feathers, especial attention being paid to the head and neck and under parts of the wings and body. A single large louse fastened on the head or under the throat of a young turkey will kill it. A drop of oil rubbed on these spots will kill them. After killing the lice keep the young turks away from lousy quarters and from other fowls.

Many people do a thorough job in destroying the lice, but immediately undo it by returning the turks to lousy quarters. Others destroy the lice in the houses and coops, but neglect to get those on the birds. While one is about it, he should make a thorough and clean job.—Farm and Fireside.

FEEDING COOPS.

When we get a large number of chicks on one plot of ground of differing sizes there is apt to be a great deal of trouble at feeding time by the big ones trampling the little ones and getting more than their share of the feed. To remedy this provide one or more slatted feeding coops. Arrange the slats so only the tiniest chicks can get through to the inside. Make another admitting a larger size, etc. Now feed the tiniest ones first, inside their coop; then the next size and so on till the job is done. The reason for this, you will readily see, is that if you feed the largest ones first the little ones will slide in along with them and be trampled upon, while if they get their food first they will be busy when the large ones are feeding. These coops should be moved to fresh ground often to insure a clean surface to feed upon. No chick can thrive that is being constantly tramped upon and these little coops are inexpensive, saving the price of themselves in a single season.—Farmer and Breeder.

RHODE ISLAND REDS.

Breeders of the Rhode Island Reds will be interested in the instructive and beautifully illustrated book on this breed recently published by the Reliable Poultry Journal. It gives the history and origin of the Reds, tells how to select and mate both for exhibition and utility qualities, how to judge by comparison and score card, illustrating the Drevenstedt comparison card, and covers all subjects pertaining to their successful breeding.

The book was edited by D. E. Hale, judge and breeder, and the contributors of articles are the leading breeders and judges of the country. Fully illustrated by Messrs. Sewell, Schilling and Burgess. The text and illustrations conform to present standard requirements.

"Rhode Island Reds" contains 30 pages printed on first-class paper with heavy paper cover. A color plate of feathers by Sewell. Price 75 cents postpaid.

Diarrhoea, bowel trouble, leg weakness, eating one another's toes and like disorders would not occur if the chicks had the opportunity to exercise in the open air on the ground every day, were properly fed, and had green food in reasonable quantities. The main causes of diarrhoea in young chicks are exposure to heat, to damp, or cold; irregular feeding of mash, wet food, or feeding too much green food, following none at all, and beef scrap unfit for them to eat, or anything that will ferment or sour in their crops.

WHAT IS YOUR POULTRY WORTH?

It has a value, but that value is determined by and dependent upon health conditions. Best and surest poultry health can be obtained and maintained by using

GERMOZONE

A preventive and cure for Roup and Cholera unequaled in efficiency. Germozone is a germicide, a cure and preventive of Cholera and Roup. It is a system builder. It goes to the seat of trouble and usually effects a permanent cure.

Given in the drinking water *twice a week* it cures disease, prevents contagion and keeps the fowls in a healthy, vigorous condition. Prepared either in tablet or liquid form, 50c. We pay postage on tablets.

Germozone is the best health insurance you can have for your poultry. Cost is small and it is sold *on an absolute guarantee.*

Germozone is not an experiment. It has been doing for years for Mr. Lee just what he is telling it will do for you.

LEE'S EGG MAKER

is not a medicine. It is a scientific food product compounded by Mr. Lee, who is a *poultryman* of 25 years' experience. If it were not for the success claimed for it Mr. Lee would never have offered it to the public. That is one broad, sweeping assurance any poultryman has who buys Lee products —they know his own flock has demonstrated their worth to him.

READ THIS GUARANTEE

We guarantee that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if Lee's Egg Maker is added to the daily ration—made a portion of it—the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and 100 per cent profit on said labor.

25c, 50c, $2 sizes. The smallest size is large enough to prove you ought to buy more. A larger size would do it quicker—and you would get a little more in proportion to the price.

Write for free copy Lee's "Chicken Talk," written by Geo. H. Lee himself. Also free Mandy Lee Incubator catalog. Yours by first mail.

Don't Depend On Rainfall For Your Water Supply

The farmer who depends on rainfall for his irrigation generally finds that when his crops need water most they are least liable to get it. Make your irrigation system independent of rainfall and all other outside conditions by using one of the famous

I H C Gasoline Engines

They pump water from streams, lakes, rivers, or wells—economically, steadily, and easily. They are simple, strong, and durable, made on correct principles, of highest quality materials, by skilled workmen, in the best equipped engine factories in America.

I H C Engines also do all other kinds of farm work, such as operating your feed grinder, clover huller, fodder cutter, and the like, better and cheaper than any other engine. The I H C line includes a style and size for every need.

Vertical type—2, 3, 25, and 35-H. P.; horizontal—1 to 25-H. P.; semi-portable—1 to 8-H. P.; portable—1 to 25-H. P.; traction—12 to 45-H. P.; sawing, pumping, spraying, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new catalogue.

WESTERN BRANCH HOUSES: Denver, Col.; Helena, Mont.; Portland, Ore.; Spokane, Wash.; Salt Lake City, Utah; San Francisco, Cal.

INTERNATIONAL HARVESTER COMPANY OF AMERICA

WHEN THE PUMP PUMPS AIR.

By W. E. Hind.

There are verses by the thousand set to music, prose and rhyme,
Of men on land and water, in every state and clime,
Who have faced the brunt of battle, mingled with the shot and shell
And oft with scars of glory dashed into the mouth of hell.
But there is an unknown hero of whom I fain would sing,
Who tho battle-scarred and weary is still in the fighting ring,
'Tis he who owns an orchard with a first-class steam drilled well,
But whose pump—a fiend incarnate—has oft gone straight plumb to——

Well, listen, while he tells the story with drawn lips and bated breath
How the water came in plenty—how there were but three rows left:
How he figured on some fishing by a shady, mossy shore:
How the water ran so smoothly; how there were but two rows more,
When, oh when, O saints preserve us, by my father's silvery hair,
He stood with limbs atremble watching Mr. Pump—pump air.

Then he hied him to the stable hitched up the dark bay mare
Sent her flying o'er the hillside straight toward the pump men's lair.
"Where's the boss," he wildly stammers, "can I get a gang to come
"To the ranch this very instant, my doggasted pump is on the bum."
Hear the foreman calmly answer—"What's the matter—pumping air?
Well, you are only one of many, but we'll get a gang out there."

Say, that dream of trout abundant, tired feet dangling in the blue
Never looked so fair, entrancing, but such dreams are sad—not true,
For to work he must be going, man the derrick, pull the pump,
Get more casing, rods, etc., keep the hired help on the jump,
For the pump must go down deeper and there'll be no cooling breeze,
'Till the water's once more flowing 'round those last two rows of trees.

TRANSFORMATIONS OF WATER.

It is not strictly true that the total amount of water on this earth is a constant quantity, for the reason that water will temporarily enter into combinations where its function as water is lost. This is particularly true regarding crops which require a large amount of water for their growth transforming it into sugar, starch and other substances. Of course, when such crops, fruits or vegetables reach their final stages in consumption the bound water will be released and finally find its way into the general storage reservoir of nature which is the ocean. Thus the mechanics of nature's water supply are easily understood. The motive power of lifting the water from the ocean to the top of the mountains is, of course, the sun. It is a fact that the power of the sun's rays evaporates thousands of tons of water per second from the various oceans in the form of an invisible vapor which rises in the air on account of its lightness; on reaching higher altitudes where the temperature of the air becomes cooler the air is unable to carry as much water vapor and a portion of the latter is condensed into fine drops which form the familiar clouds in the sky. As these clouds undergo farther reduction in temperature, more vapor is condensed and the clouds become finally so heavy that the air no longer can carry them and precipitation is the result either in the form of rain, hail, snow or dew. The air is never completely free of moisture as it would be impossible to live in air devoid of water vapor. There is, however, a point beyond which air will not carry water vapor and this is called the point of saturation. This point varies with the temperature of the air; the warmer the air the more vapor it will absorb. Thus when winds carry the warm air from the tropical zone into colder regions formation of clouds takes place because the colder air refuses to carry the excess of moisture.

On the Island of Hawaii these phenomena may be observed to very good advantage. There is a mountain range running from north to south through the island; the northeast trade winds blow for about nine months in the year carrying a balmy air saturated with water vapor which has been taken from the water of the Pacific ocean; when the winds strike the cooler highlands and mountains of Hawaii condensation sets in and clouds form causing abundant precipitation; but this just happens on the east side of the mountains; the west side of the range is entirely barren as the air having been robbed of its moisture by the eastern slope refuses to give up any more moisture in the shape of rain or dew. Thus the island of Hawaii presents on its eastern slope the features of a paradise, while its west coast has the aspect of a desert.

It is seen thus that the water supply which nature has provided for instance for these United States, has its power house in the sun, its boilers in the lakes of the United States and the surrounding oceans and its natural storage in the vastness of the Rocky Mountains. The travel of the water is thus: From the ocean in the form of vapor or cloud to the mountains where it is precipitated either as rain or snow. Hence the rain by the force of gravity first forms little brooks which finally gather into rivers and travel down, down to the ocean, where Old Sol remains busy to keep the process agoing.

The water in the form of snow is a wise provision in nature as this is kept, so to speak, in cold storage until the hot sun of the summer months does some more necessary work in melting the snow at a time when natural precipitation is at its minimum, and the melting snow in the mountains thus provides a means of feeding the brooks and creeks and supplying the life-going and life-sustaining fluid to man, beast and plant. This shows also the necessity of keeping the mountain slopes well timbered to prevent the erosion of the soil by the rapid flowing waters.

Another factor in the characteristics of water must be reckoned with, especially by the irrigationist. This is that a heavy percentage of water is lost on its way from the mountains to the ocean by following subterranean passages. Thus although the water itself is not lost, for there is nothing lost in the economy of nature, it fails to do any useful work on its way down to the ocean and may be stranded by getting boxed up in subterranean basins. These are tapped frequently successfully by wells and the water thus obtained will do duty in various ways, but it is seen that by the water being allowed to escape below the natural surface of the ground it will have to be lifted from its hiding place by pumps, which is expensive, while the force of gravity is free. Hence it will be a wise move to watch the more important rivers and irrigation channels and reduce this leakage to a minimum.—Irrigation Age.

Questions and Answers

Peaches Not Bearing.

We have a peach orchard three years old, some trees in which have no fruit, others just a few. Trees growing very rapidly, soil sandy loam in the foothills of this valley. Water was scarce last fall, but is now plentiful. Orchard has good tillage; pruned properly, we think. Other orchards four miles away loaded. Our trees blossomed well, but blossoms all fell off; no frost. Trees do not need nitrogen, for they are growing too rapidly. Will a good dose of potash help another year? If so, how much should be applied? Will summer pruning aid in setting crop next year? Crop last year was good for two-year-old trees. —Subscriber, San Bernardino.

The cause of this failure cannot be told with definiteness from the description given. A number of things may have occurred to prevent this year's crop. Our first guess, and it is little more than a guess, is that "water scarce last fall" may account for the shortage. It must be borne in mind that deciduous trees forming their fruit buds for the next crop late in the season's growth, if deprived of moisture at the critical time, may not give enough vigor to the fruit buds to set the fruit. Again, the climate this spring at blossoming time may have been such that the fruit could not set. We note "no frost," but frost is not always the only cause of a short crop. The warm soil, which might have brought out very early bloom, with a dash of rain when the trees are in fullest bloom, or a hot wind or other unfavorable climatic conditions, might have resulted entirely differently with these trees than with others a few rods away. Then it might possibly be that the variety is such that it will not bear heavily nor until more mature wood is made. We note they were "pruned properly," but if the pruner was desirous of shaping a big, woody top, it is possible that heavy winter pruning removed much of the fruit wood and stimulated strong wood growth. Pinching back new growth and forcing fruit buds which are supplied with abundant nourishment through late irrigation may help another season's crop. The applying of potash may assist in the fruit formation, and to that end an application of, say, 300 pounds of muriate of potash per acre might be beneficial.

Preparing Land for Potatoes.

I have two acres of land which I want to plant to fall potatoes. Two years ago I pulled out grape vines which had been growing for 27 years, have had two crops of hay and planted potatoes last August, but only got about 25 sacks to the acre. What is best to do with this land, what should I put on in the way of fertilizer and what else should I do to insure a good crop? The soil is heavy but not an adobe or clay soil, works up nicely. I want to plant about August 1st. Will plow in about a week.

It is rather late to begin preparation of this soil for August 1st planting. On taking off your crop last year you could have helped the land materially by green manure crop. This could have been supplemented by a heavy application of strawy manure plowed under at time of plowing the green manure crop. Of course the application of a commercial fertilizer rich in potash might be beneficial, but we take it your soil is more in need of a mechanical treatment than chemical. Humus you must have.

Sweet Pickles.

For an inquirer who wished a sweet pickle recipe we repeat from a former Cultivator:

Put cucumbers in cold weak brine (½ cup salt to one gallon of water) for 24 hours. Take out and dry on cloth. To one gallon vinegar add two cups sugar and nearly one ounce of mixed spice, heat boiling hot. Put in pickles and let boil up once. Put in cans immediately, and pour hot vinegar over them; seal up. They keep well, and are very nice.

Another recipe is as follows: Let the cucumbers stand in salt water

three days. Heat the brine once or twice and pour over them. Drain; put in a jar and pour over them hot vinegar with cloves and cinnamon in a bag; two-thirds cupful sugar to quart of vinegar; put in plenty of horseradish and this will keep sealed or open. Put in a little alum to make them brittle.

Green Geese.

I want to know if there is any market in California for green geese. Also the best method of fattening the young geese for this condition.—Mrs. L. L. G., Lancaster.

There is a good market in Los Angeles for green geese; that is to say young geese. They are easy to fatten; in fact, if they have access to soaked barley at least three times a day and are finished off with kaffir corn or whole corn for about two weeks before marketing they will be in prime condition. They need not be kept enclosed in a yard or pen, but simply fed three times a day all they will eat. Geese are the easiest fattened and the easiest raised of all fowl. There is good profit in geese. —Mrs. A. B.

Asparagus Tops.

Should I cut tops of asparagus at this time of the year?—C. M., Arroyo Grande.

It would be great injury to the asparagus to cut off the tops at this time. It is upon healthy, vigorous foliage that the plants depend for their root development; and if you do not secure a good strong root system you will have poor tops next year. Sacrifice the corn and give the asparagus water and cultivation until fall.—Q. A. L.

Tomatoes Dropping.

My tomato plants, the thriftiest I could secure at the time of setting, and given best of care, refuse to set fruit. They blossom plentifully, but after blooming drop off at stem and no fruit whatever sets.—E. E. M., Pasadena.

The cool season has doubtless been responsible for this trouble, though the variety may have something to do with it. Only the very earliest varieties will set fruit during such cool weather as we have had this season. Possibly too much water may have been one trouble with your plants, so that their strength has gone to wood growth. Withholding of the water with the warmer weather coming on should result in setting a heavier crop.

Questions of a Beginner.

At what age should I sell my roosters? They are now three, four and five months old. They are Rhode Island Reds. Is blue stone good to use in the water that chickens drink? Is permanganate of potash good in their water?—E. T., Watsonville.

You can sell your cockerels at any age that you choose when there is a good market for them. The three-months-old would be, if properly fed, good broilers or friers, whilst the five-months-old ought to make very nice young roasters or even friers. Sell when there is a demand, or when you want to make room for the pullets or other stock.

Blue stone is a good germicide. That is, it will kill germs of almost every kind. You can use it with advantage if there is roup or colds among the chickens. Do not put more than a small bit as big as a navy bean in a quart of water, no stronger. It is a poison, so keep the pretty bits of blue out of reach of the children. Permanganate of potash is a good disinfectant and can be used if there is disease in the yards, especially for roup. Mix a small amount in the water until the water is colored a pretty pink. The water should be changed three or four times a day, or as soon as it loses its pink color. These two drugs, either combined or separate, are what is given in the different roup cures in the drinking water.—Mrs. A. B.

Aphis.

What is remedy for green aphis on plum trees?—Subscriber, Fruitland.

Green aphis are easily destroyed by kerosene emlusion or tobacco extract spray, or even by the use of water with force from the nozzle of the hose. The tribe increases so rapidly, however, that they will soon return. Continued treatment will be necessary unless weather conditions favor their destruction.

Ants on Rhubarb.

What will destroy ants on rhubarb? Have sprayed with borax, also tried wood ashes and drowning by heavy irrigation.—Subscriber. Delano.

Locate the hill and if it is some distance from the plants, pour a tablespoonful or more of carbon bisulphide down the entrance and cover with a wet sack. Around the plants a liberal scattering of buhach will aid in driving the insects away. The best method, however, is their total destruction in the hill by the carbon bisulphide or boiling water, or even gasoline or kerosene.

Topping Eucalyptus.

Will you please let me know through the columns of your paper which is the best time in the year to top eucalyptus trees. I have a number of trees in my chicken yards, some are two years old and about twenty feet high, the rest were planted in spring, 1910, and are about twelve feet high. I intend to top the trees to give my chickens more shade.—J. R. H., Arroyo Grande.

The safest time of the year to top eucalyptus is in the late fall, but where considerable foliage is left on them they may be topped at any time. Where cut back to a stump in the spring it may endanger the life of the tree, but we have never seen a tree cut in the fall that did not sprout out the following spring.

Blight.

My tomato plants wither, the leaves curling slightly, and later the plants die. They have been frequently watered. The ground is heavy but is kept well cultivated. Tried soapsuds and kerosene on one plant but without results.—Subscriber, Reedley.

This we think simply the ordinary summer blight and the most deadly disease of tomatoes. There is no help other than to prepare for it by securing a new location for next year's plants where tomatoes have not been planted before. The blight is a bacterial trouble which infests the soil and is within the tissues of the plant so that no spray will reach it.

Guavas Not Bearing.

I have a guava bush eight feet tall, six years old, one and a half inches at butt; it blooms, but most of the blooms prove false; all the other trees in the row bear well. Have any of your subscribers had experience in budding or grafting a tree like this?

BUY THE LOWEST COST ENGINE MADE. Lowest fuel cost; lowest up-keep cost; easiest on the machine it operates, delivering steadier power than any other gasoline engine, adapting it especially for operating farm machinery, with better results and least waste of grain. Lowest fuel cost for it runs on Gasoline, Kerosene, Distillate, Gas or Alcohol and has perfect lubrication. Lowest cost because it delivers greatest available power per horse. A slow speed, high duty engine. Starts easier and quicker than any other engine, occupies less space, is less cumbersome, with less vibration, therefore adapting it for either stationary, portable or traction use. **IT IS THE POWER CONTRACTOR'S FAVORITE ENGINE.** No engine made has so wide a range of use. **YOU WILL MAKE A MISTAKE IF YOU DO NOT WRITE US FOR INFORMATION.** 1½ H. P. to 5½ H. P. single cylinder. 6 to 20 H. P. two cylinder. 30 to 50 H. P. four cylinder. State your requirements and get our advise. **THE TEMPLE PUMP CO., Manufacturers, care of David Rutherford, 1396 Harrison St., Oakland, Cal.**

If so, what season of the year did they do it, and how?—B., Pasadena.

We pass this on to our subscribers and ask their experience in this matter. We believe it due to the variety and fear these bushes will never bloom satisfactorily. However, if we had the plants, we would do some experimenting with pruning and fertilizing and other methods of encouraging setting of fruit.

A GOOD GUESS.

The entertainer was seemingly in good voice as he began: "Ladies and gentlemen, having blindfolded my partner, I will now proceed to test her thought reading powers. I have in my hand an apple. Will you kindly tell the audience what it is that I am holding in my hand?" "An apple." "Correct. I have here a watch. Kindly tell the audience what I have." "A watch." "Quite right. You see, ladies and gentlemen, it is impossible to catch her." The entertainer produced a piece of wood and a saw, and commenced to saw vigorously. "Kindly tell the audience what I am doing." No reply. "This is rather a difficult feat, ladies and gentlemen. I will try again. Can you tell me what I am doing?" said the entertainer, continuing his sawing. "Yes. You are singing." Loud applause.—Exchange.

THE UNHAPPY JESTER.

"I hear poor Dobbs, the humorist, has gone to a sanitarium," said Binks.

"Yes," said Higgins, "he's worked himself into a state of nervous prostration that I fear is incurable."

"That's too bad," said Binks. "How did he came to do that?"

"Why, six weeks ago he got an answer to a riddle. 'One's a chau-ffeur, and the other's a fur show,' and he says he'll never be able to sleep until he finds the question it will make a good answer to."—Marper's Weekly.

Young man—I've called, sir, to request the hand of your daughter in marriage.

Old Grumleigh—Has she accepted you?

Young Man—Yes, sir.

Old Grumleigh—Then what do you want to come around and bother me with your troubles for? — Chicago News.

"Good morning, ma'am," said Willie doffing his cap.

"My! What a polite little boy!" exclaimed Miss Passey.

"Do you always take off your cap like that to ladies "

"No'm; only to old ladies."—Philadelphia Press.

Father Knew—Curious Charley—'Do nuts grow on trees, father?"

Father—"They do, my son."

Curious Charley—"Then what tree does the doughnut grow on?"

Father—"The pantry, my son."

"Oh, Willie, what's this queer lookin' thing with about a million legs?" 'That's a millennium. It's somethin' like a centennial, only it has more legs."—Life.

FOR EXCHANGE

For Exchange—1080 acres in prosperous and fast developing part of Kings County; a fertile sedimentary loam, level as a ballroom floor, and absolutely free from defects such as hardpan, alkali, sand, swales, etc. Suited to alfalfa, sugar beets (factory within 20 miles), vines, fruits, grain, etc. Would make first-class dairy, hog or stock ranch. Lies within proven flowing well district and has joint water right in well and ditch water systems. $64,800, cash value; mortgage $8,640. Will take Southern California city or country property, improved or unimproved, to same value. John W. Thomson, 220 S. Main, Los Angeles, Cal. Main 1209, F 3764.

LIVE STOCK

STALLION FOR SALE.
The Imported Percheron Stallion
SANSONNET.
Color gray. Foaled March 1, 1905.
SANSONNET was considered by Mr. Charles Aveline, President of the Percheron Society in France, to be the best two-year-old that he ever raised With immense size, heavy bone, short legs and enormous width, Sansonnet possesses in the highest degree all the qualities most sought for in a perfect draft horse. It is not often that such an extraordinary individual is permitted to leave his native country, and the breeders of America are very fortunate in securing the services of a horse that any breeder in France would be proud to place at the head of his stud of pure-bred mares.
SANSONNET was entered in the Colt class and open class at the International Live Stock Show, Kansas City, Mo., in 1906, and took the blue ribbon in both classes. Weight 2,000 pounds. Sure foal getter and splendid disposition.
Terms to responsible parties. Apply to Wm. M. Way, Secretary Farmers Percheron Horse Association, R. F. D. No. 5, Modesto, Cal

MISCELLANEOUS

Free—"Investing for Profit" Magazine. Send me your name and I will mail you this magazine absolutely free. Before you invest a dollar anywhere get this magazine—it is worth $10 a copy to any man who intends to invest $5 or more per month. Tells how $1,000 can grow to $22,000; how to judge different classes of investments, the real power of your money. This magazine for six months free if you write today. H. L Barber, Publisher, R. 430, 28 W. Jackson Boulevard, Chicago, Ill.

For Sale—Complete Home Canning Plant, capacity up to 500 cans per hour. Wanted—Any amount and variety fruits in cans, provided canned ripe and right where grown. Growers Home Canning Co., 221 Exchange Bldg., Third and Hill Sts., Los Angeles.

POULTRY SPECIALITIES.

Special Incubator Offer—We are overstocked on 130-egg size Success Incubators. We offer 50 of them at $10 each as long as they last; regular price $14. Order now. E. E. McClanahan Incubator Co., 112 East 8th St., Los Angeles, Cal.

POULTRY

Lasher's Hatchery, 15 Kent St., Petaluma, Cal.—Why my chicks live and grow in the hands of my customers. They are all hatched from free range stock bred right, mated right, fed right. I have the most up-to-date hatchers building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks. 16 years in the hatching business 10 years at present stand. It is no experiment or guesswork with me. Am now booking orders for August and later delivery. On account of time and room, will sell all of my Belgian Hares, 200 breeders, young and old. Write for prices on just what you want

All We Know is Rhode Island Red Chickens. But we know them so well that our baby chix, $15 a 100, are the best on earth. There! Pure blood, good strains, well mated by expert breeders. I. X. L. Poultry Yards, 587 Mission St., Santa Cruz, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5.00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Eggs at half price, $2.50 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

Rose Comb R. I. Reds—Eggs one-half price balance of season. A few breeders for sale. Young stock later. Mating list on request. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Household Department

THE FITNESS OF THINGS.

"I'm going to live in the country," said the city man one day,
"I'm going to revel in songs of birds and the perfume of new-mown hay.
I'm going to gather the blossoms bright and gaze on the butterfly
And list to the mystical melodies when tremulous branches sigh."
But the bird he heard was the querulous owl who kept him awake at night,
The insect he met was a hornet; and his was a sorry plight,
In the course of his botanizing he gathered a poison vine
And he hurried away to the station and said: "It's the city, boys, for mine!"

"I guess I'll go up into town awhile," said Uncle Bill one day,
"I'll have a look at the 'lectric lights an' be careless an' downright gay!"
He looked in vain for thoughtless glee in the crowds that went madly by;
He got mixed up in a motor car and a cabman hollered: "Hi!"
He ate a dinner he didn't like, and went to a dreary show,
And slept in a room just six feet square, and he murmured: "I guess I know
When I've had enough. At break of day I'll be headed for home. You see,
The city's the place for city folks. An' the farm is the place for me!"
—Washington Star.

WILL 300 CHICKENS SUPPORT A FAMILY.

A. J. Waterhouse, in the San Francisco Star, says:

Among the weighty questions which will agitate the American Egg Laying Congress (why it should have been so named when it is understood that the congress will lay no eggs, I do not know), which is to meet in Spokane, is reported to be the following:

"Will 300 chickens support an average family?"

Without desiring to disturb the congress while it is setting, I wish to remark that 300 chickens will not support an average family. I speak as one having authority, for I have, in a limited degree, tried it.

A friend of mine first called my attention to the wealth producing possibilities of the chicken business.

"You start with, say, a hundred chickens," he remarked. "They should, if properly fed and cared for, lay at least forty eggs a day. This would be a total of 14,600 eggs in a year, not counting the extra day in leap year. You would set these eggs under some energetic hens, and, allowing for breakage, etc., they would hatch—that is, the hens would—13,100 chickens. At the end of a year, then, you would have 13,100 chickens. If you were intending to go into the business on a small scale these might be enough, but I should advise against that. On the contrary, you would take their eggs—amounting, at the same laying ratio, to 191,260—and set them again. Allowing that but 160,000 hatched, and again saving their eggs and setting them as before, you would at the end of the year have 23,564,360 grown fowls and chickens. Some people might continue to set and hatch, but I should advise beginning to sell the eggs at this time, or you might keep them a few weeks and then sell them at, say, forty cents apiece, and retire on the $9,000,000 or $10,000,000 you then would have, of course, whether or not you desired to be inordinately wealthy."

I had had no previous experience with the hen business, but I examined his figures, found that they were all right, resigned my position, and bought 400 chickens fresh from an incubator. Just 117 lived, and of these 83 were roosters. These should have laid 47 eggs a day, according to my friend's reckoning, but I didn't believe that 34 hens could do it without being overworked, and I object to cruelty to dumb animals.

So I sold most of the roosters for part of what their feed had cost, and bought another hundred chickens. It was a bad spring, and all but thirteen died, and eleven of them were roosters. So I gave it up, and bought some grown hens.

It is a solemn fact that those hens watched the egg market, and were very ungrateful for the food I fed them. When eggs were fifteen cents a dozen they laid nobly; if they went up to twenty-five cents they laid occasionally; when the price increased to forty cents or more, they didn't lay at all, but they ate more than when they were laying. Once I got them to lay for a brief time by leaving a six-months-old market report in the hen house, but they soon discovered the deception. At last I arranged with the feed man to pay him off in monthly installments, and went out of the business.

Conversation with a number of people who have tried a similar experiment has convinced me since then that I am not alone in such experience, and, after considerable consideration, I have concluded that the question to come before the congress must have been misstated in the press reports. Beyond doubt, I think it should read:

"Can an average family support 300 chickens?"

My opinion is that it cannot.

CONUNDRUMS.

When does a man rob his wife
When he hooks her dress.
Why is marriage like the Bible?
Because it ends in revelations.
How can a man make his money go a long ways?
By contributing to foreign missions.
Why does a pig eat?
To make a hog of himself.
Why is it dangerous to keep a clock at the head of a pair of stairs?
Because it sometimes runs down.
Why are hogs like trees?
Because they root for a living.
Why is a plumber like a pelican?
On account of the size of his bill.
Why was the first day of Adam's life the longest?
Because he had no Eve.
When may a man's pocket be empty and yet have something in it?
When it has a hole in it.
What bat flies without wings?
A brick bat.
Why is a tramp like white flannel?
Because he shrinks from washing.
Why is Ireland likely to become the richest country in the world?
Because its capital is always Dublin.
Why is your nose in the middle of your face?
Because it is the center.
What is the difference between one pretty girl and an apple?
The apple you squeeze to get cider,

and the pretty girl you get side-her to squeeze.

What is the difference between one yard and two yards?

A fence.

What is the latest thing in dresses?

Night-dresses.

What relation is that child to its own father who is not its father's own son?

Daughter.

What is the difference between a dog's tail and a rich man?

One keeps a waggin, the other a motor car.

When is butter like Irish children?

When it is made into little Pats.

When you open the window of a railway train what is the first thing to catch your eye?

A cinder.

What should be put up for a rainy day?

An umbrella.

What darkness is it that can be felt?

A black derby hat.

In what place are two heads better than one?

In a molasses barrel.

Who are the men that have made their mark?

Those who cannot write.

If your uncle's sister is not your aunt, what relation is she to you?

Your mother.

What is the difference between an oak tree and a leopard's tail?

One is rooted to the spot and the other spotted to the root.

What is it that a man, no matter how smart he is, overlooks?

His own nose.

When does a ship tell a falsehood? When she lies at the wharf.

What is the best way to keep loafers from standing on the corners? Give them chairs and let them sit down.

Why do hens always lay eggs in the daytime?

At night they are roosters.

What is the hardest key to turn?

Donkey.—Success Farming.

HOMELY HINTS.

Clean mirrors, window panes, etc., by washing with a cloth dipped in alcohol and polishing with a chamois skin or crumpled tissue paper.

To polish cut glass, wash it well with soapsuds, rinse, and then, after drying it with a cloth, polish it with sawdust and a washleather. The glass will be brilliant after this treatment.

To restore faded upholstery, beat the dust out well, then brush. Apply strong lather of castile soap with hard brush, wash off with clear water. Then wash with alum water. When dry the colors will look as well as ever. When colors are faded beyond recovery they may be touched up with a pencil dipped in water colors of suitable shade mixed with gum water.

Make bags of heavy canton flannel with a drawstring at the top to place over the broom and dust the walls with. Have the fuzzy side out.

If silver which is not to be used often is kept in dry flour it will not tarnish, and will need only to be brushed off when wanted for use at a moment's notice.

In laundries starched clothes are dried indoors to keep them stiff. If they need to be bleached they are hung in the sun, and afterwards starched and dried indoors.

Small tin cans can be used for gem or patty cake pans by melting both ends from them and standing them in a dripping pan. The cakes will easily slip out of the bottomless rings.

Gasoline stoves that have to be flashed are more cleanly by using wood alcohol in starting. An old toothbrush is fine to rub wicks on kerosene stoves.

Perspiring hands make it well nigh impossible for many persons to work on delicate fancy work during hot weather. If persons so afflicted will bathe the hands in strong alum water before taking up their work they will have no further trouble. The same treatment before putting on gloves will prevent their being spoiled by perspiration.

FLY POISONS.

A cheap and reliable fly poison, which is not dangerous to human life, is bichromate of potash in solution. Dissolve one dram, which may be bought at any drug store, in two ounces of water; add a little sugar, and place about the house in shallow dishes.

To clear rooms of flies, use carbolic acid, heating a shovel and pouring on it twenty drops of the poison. The vapor will kill the flies. Another method: Burn pyrethrum powder in the room. The flies will fall to the floor stupefied, and may be swept up and burned. The powder should be moistened and molded into cones, and, after drying, each cone should be placed upon a dish and lighted at the top. It will burn slowly, and the odor is not disagreeable.

Flies pass the winter hidden in cracks and holes in attics and cellars. Many of these may be killed in the spring by the two methods just described.

Be sure that all drugs and chemicals used are fresh and pure, otherwise results may not be satisfactory.

THEN HE SHOOK HANDS WITH HIS SON.

"You look like a fool!" thundered the disgusted man to his swell son, just in from college. "More and more like a conceited, harebrained, helpless fool every year!"

Just then an acquaintance of the old gentleman entered the office.

"Hello, Charlie, back, eh!" he exclaimed genially. "Say, you're getting to look more and more like your father every year."

"Ya-as," said Charlie, "that's what the governor's just been telling me."

CHEER UP.

Cheer up!
What if the day's cold
And you're feeling old
And blue
And disgusted, too.
We all do!
Take a brace,
Look trouble in the face
And smile
Awhile.
Nothing's gained by looking glum—
Keep mum.
Put your woes on the shelf,
Keep your troubles to yourself
And—CHEER UP!

Nothing truly can be termed mine own
But what I make mine own by using well;
Those deeds of charity which we have done
Shall stay forever with us; and that wealth
Which we have so bestowed, we only keep;
The other is not ours.—Middleton.

De man dat can't sing an' insists on singin', deah breddern, is nearly as much ob a nuisance as de man dat knows how to sing, but who hez to be coaxed like a balky mule before he'll open his mouf.—Plink Plunk.

American factories are turning out a cartload of watches a day, and yet people come in late to church the same as of yore.

STURDY TOOLS FOR TRYING JOBS
Here is a Keen Kutter Fork—a sturdy bit of springy timber, tipped with three properly curved tines of finest steel, tempered like a watch spring. When this fork is sunk into a well settled bunch of long hay, a man's strength is needed at the end of the handle.
KEEN KUTTER
Farming Tools
—hoes, forks, rakes, scythes, axes, spading forks, corn knives, shovels, spades, ditch tools, manure hooks, potato hooks and bush hooks—are all remarkable for their working capacity. A brawny man and a Keen Kutter Tool is a combination hard to beat when it comes to actual results in work accomplished.

Hay.

Scott, Magner & Miller say:

Arrivals for the past week have amounted to 2211 tons. This amount shows a continuation of the light receipts that we have had for several weeks past, and yet there has been enough coming into San Francisco to very easily supply the demand.

The shipments have consisted recently of a larger percentage of new crop than heretofore, although there is still much old directed toward our markets.

Shipping trade has been rather quiet recently as there have been no orders of any extent placed here for shipment either along the coast or for exporting.

What alfalfa has been coming in has consisted of first-cutting, although there is a little second-cutting now being directed to our markets.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	14.00@14.50
No. 1 wheat or wheat & oat	11.50@12.50
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	12.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	5.50@6.50
Alfalfa	9.00@10.50
Straw, bale	40@50

Grain.

Wheat	1.42½@1.50
Barley, fancy	1.27½
Barley, good to choice	1.25@1.27½
Oats, white	1.50@1.60
Rye	1.50@1.60
Mustard, brown	5½
Alfalfa seed	18
Millet	3@3½
Flaxseed	5@5¼
Brom corn seed, ton	25.00@30.00

Feed Stuff.

Alfalfa meal	14.00

Deciduous Fruit Market

SACRAMENTO, July 15, 1911.

Manager F. B. McKevitt of the California Fruit Distributors reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, July 14th, 1911:

Cherries—7½ cars. Cherry shipments have kept up better than expected. They have been running as high as two cars a day occasionally, but dropped off to less than one car on the 13th, and none at all on the 14th. Movement is now practically concluded.

Apricots—8 cars. So few of this variety are now available that they are not worth mentioning. Movement will entirely cease this week.

Peaches—83 cars. This fruit has not been in as large supply as expected last week, and will continue light for the week to come. The early varieties are now nearly done. Early Crawfords and Fosters are beginning to make their appearance. Car lot shipments of these varieties will begin next week from the San Joaquin Valley. Quality of the fruit is fine. About the 20th of July the heavy movement of peaches will begin and will continue for about three weeks. The crop is not as large as expected.

Plums—184 cars. It is likely that the plum movement was as heavy the past seven days as it will be at any time during the season. The early sections are now practically through with the heavy shipments, although they will continue in lighter supply for the next three weeks. In the Valley the large shipments are just beginning. Offerings for the next seven days will probably be considerably lighter than during the past week. Tragedy, Sugar, Bradshaw, Wickson, Santa Rosa, Comedy and a few Diamonds will represent the varieties available next week.

Pears—60 cars. Bartletts from the river are now coming in more freely, movement for the past seven days being nearly five times as large as the previous week. Fruit is now better developed, both for size and quality. It is expected that shipments of this variety will be as large during the next seven days as at any time during the season. There has been some complaint of the reappearance of fire blight in the pear orchards, but same will not affect the output this season.

Grapes—The first shipments of Fontainbleaus from the Vacaville section appeared several days ago. Carlot shipments of Thompson Seedless are now going forward from the Imperial district and some have already reached Eastern markets. Outlook for the grape crop continues fine. Mildew has appeared in several different sections, but is being promptly looked after, and it is not expected that it will have the effect of materially decreasing shipments.

Weather is seasonable and pleasant—considerably warmer than it has been in the past, but ideal for fruit.

Shipments of fruit from this state so far this season have been disappointingly small. On July 14th, 1910, total shipments amounted to 2460 cars. On the same day this year the total had only reached 1198¾. Allowing for 100 more cars, owing to the increase of the minimum from 24,000 to 26,000 pounds, would give us a total of 1300, as compared with 2460 last year, or a little more than half. Owing to this very considerable shortage there has not been enough fruit to go around, practically every market requesting supplies which were impossible to furnish. After this week an increase in shipments should begin to cut down this great difference.

Citrus Fruit Market

LOS ANGELES, July 19, 1911.

With fairly liberal shipments of oranges going forward it is gratifying to note the reception they are being given in all parts of the East. The trade has invariably slowed up after the Fourth of July trade has passed, but this year is an exception and good demand continues. The fruit is carrying exceptionally well even to the farthest Eastern points. From 50 to 75 cars are going daily and the 4,000 to 5,000 cars yet in California will be cleaned up before the end of the season. As to the coming crop the weather has proved so favorable that there has been practically no drop, and so far as can be judged at this season next year's output will be heavy.

Weather conditions having materially modified over the East, the demand for lemons has slackened somewhat, so that prices are not up to last week's standard. Markets have been reached never before entered by California lemons, and it is felt that the reputation secured will materially aid in future sales. Foreigns are still coming, but Californias are a long favorite.

Shipments.

Shipments of oranges to date since November 1st, 1910: 33,507 cars, lemons

Cream Separators, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

5,520, total 39,027. To same date last season: Oranges 23,028 cars, lemons 3,751, total 26,779.

NEW YORK, July 17.—Eighteen cars Valencias, one car grapefruit sold. Valencias higher. Raining.

For Every Farmer and Live Stock Raiser

Know Your Live Stock

Be Wiser Than Other People

At least ninety per cent of farm animals when sick or injured are not seen by a Veterinary Surgeon, therefore a practical knowledge in their care and treatment is invaluable to every farmer and may be the means of saving thousands of dollars in needless losses every year

THE UNRIVALED LIVE STOCK ANATOMICAL CHART

Will Show You the Way

This chart is a practical education in the anatomy and common diseases of farm animals. It will fill the need of every farmer or farmer's son who has not had the opportunity of attending an Agricultural or Veterinary College. Any live stock owner who refers to it once will not take any amount of money for it after he has demonstrated its practical value.

Convenient Reference Size *Six Full Pages*
Twenty-eight by Thirty-six Inches

Best Pictorial Agricultural and Live Stock Encyclopedia

Nothing approaching it in farm educational value ever before produced.

Twenty-five Chromo-Lithographic plates delineating in vivid coloring, true to life, all the anatomy of live stock.

The *scientific accuracy* and *practical usefulness* is conceded by eminent authorities who have collaborated in the production of this splendid Live Stock Anatomical Chart.

It will give the very best information on DIAGNOSIS, TREATMENT AND REMEDY for ordinary diseases of live stock, all carefully edited especially for this work by prominent specialists of national reputation.

It also gives maps with statistics from latest U. S. Government reports on live stock and agriculture, together with other miscellaneous information of great value to the farmer and live stock raiser.

YOU CANNOT AFFORD TO BE WITHOUT IT

Be up-to-date and secure this valuable chart while you have the opportunity

We cannot describe this chart and do it justice. It must be seen to be appreciated.

The man who owns a horse, a cow, a sheep or a hog—the woman who owns poultry—will find this chart of wonderful value. It can be had

FREE

Vol. XXXVII. No. 4. LOS ANGELES: THURSDAY, JULY 27, 1911 One Dollar the Year

The Leaf Weevil a Menace to Alfalfa

By F. M. Webster, in Charge of Cereal and Forage Insect Investigations, Bureau of Entomology

The alfalfa weevil (Phytonomus murinus Fab.) is not native to America, but has been accidentally introduced from Europe, western Asia, or northern Africa, where it is common, and where, while more or less destructive to alfalfa, it is probably prevented by its natural enemies from working serious and wide-spread ravages. Just where or in what manner it was brought to this country no one knows, but it was first discovered in the spring of 1904 in a small field of alfalfa, near Salt Lake City, Utah, and attention promptly called to its presence there by the entomologist of the Utah Agricultural Experiment Station.

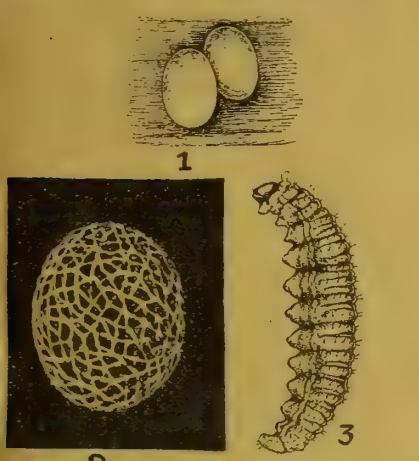

Fig. 1.—The alfalfa weevil: Eggs. Greatly enlarged. Fig. 2.—The alfalfa weevil: Cocoon. Much enlarged. Fig. 3.—The alfalfa weevil: Larva. Much enlarged. Fig. 4.—The alfalfa weevil: Pupa. Greatly enlarged. Fig. 5.—The alfalfa weevil: Adult. Much enlarged.

The Fully Developed Insect.

The beetle itself (natural size in Fig. 8) is usually less than one-fourth of an inch in length, varying from one-eighth to three-sixteenths inch, and when freshly emerged from the cocoon (fig. 2, much enlarged), within which it passes from the larva (fig. 3, much enlarged) to the pupa (fig. 4, much enlarged), is of a plain brown color. In a few days this brown becomes darker, mixed with black and gray hairs, which give it a spotted or mottled appearance, as shown, much enlarged, in figure 5. Gradually these scales and hairs become rubbed off, so that in spring we frequently observe individuals that appear almost entirely black, with small, irregular gray spots upon them.

Where It Winters.

The insect winters entirely in the beetle stage, seeking shelter, before the frosts of autumn commence, either in the crowns of alfalfa plants, close to the surface of the ground in the field, or under leaves, matted grass, weeds, and rubbish along ditch banks, haystacks, and strawstacks. Indeed, it is oftentimes found in barns where the hay is kept over winter. When this hay is being put into the barn in late summer, one side of the barn has been observed to be almost covered with adults, and in winter and spring, when the hay is being fed out, the floor of the barn will often be swarming with the beetles, like ants about an ant hill. It has been estimated that fully 80 per cent of the beetles that go into winter quarters in the fall live through until spring. With the coming of spring the beetles make their way forth from their hiding places and attack the young growth of alfalfa as soon as there is sufficient food for them. In ordinary seasons they may be expected to appear the latter part of March, and the egg-laying period usually lasts from early April until early July.

Where the Eggs Are Laid.

In very early spring, before the plants have made much growth, the beetles often push their eggs down between the leaves, the usual place of oviposition, however, being in punctures made in the stem (fig. 6), and some damage occurs at the very beginning of the season on account of the beetles puncturing the young stems and killing them in their efforts to oviposit in them. Some idea of the abundance of these eggs and the extent to which the pest may breed in vacant lots and other waste lands where alfalfa has escaped from cultivation and grows as a weed may be obtained from the fact that in one case a single plant has been found to contain 127 of these egg punctures in the midst of the egg-laying season, with the punctures fresh and new. As one puncture may contain anywhere from a few to over 30 eggs, probably 10 or 15 on the average, this single plant presumably contained between 1200 and 1300 eggs at the time it was observed. If these hatched and half of them developed into female beetles and 80 per cent of the latter passed the winter, this plant might in a year give rise to over 150,000 beetles.

The Young.

Most of these eggs (fig. 1, greatly enlarged) hatch in about ten days after being deposited, and the minute young, almost white in color, make their way to the leaves, first eating holes therein, soon assume a decidedly green color, and when full grown are about one-fourth of an inch long, with a white stripe along the back and the somewhat hooked appearance shown by some of those in the illustration (fig. 6). The attack is now confined to the young leaves and the crown of the plant, thus preventing its growth, and a badly infested field of alfalfa will frequently attain no greater height than about 6 inches, too short to mow at all. If the field is mown over most of the larvae will of course be shaken off and drop to the surface of the ground. While some of these perish, those that survive and live upon the fresh growth, together with those hatching from eggs deposited after the mowing, develop sufficient numbers to overwhelm and destroy the second crop. The larvae continue to attack the plants, being most abundant during May and gradually becoming less abundant throughout the month of June. As these transform, the adults become more and more abundant as the season advances, and not only do they feed upon the fresh growth, but they also eat the bark from the stems, and thus, where excessively abundant, totally destroy the second crop. Eggs have, however, been found as late as October 31 and larvae as late as the middle of November.

Fig. 6.—The alfalfa weevil: Larvae attacking a sprig of alfalfa. Natural size. Fig. 7.—Larva much enlarged.

Fig. 8.—The alfalfa weevil (Phytonomus murinus): Adults clustering on and attacking sprig of alfalfa. About natural size.

The entire life of the insect, from the deposition of the egg to the emergence of the adult, may be anywhere from 40 to 70 days, while the beetle itself may live, including the winter, from 10 to 14 months.

In the first four years following its discovery the alfalfa weevil has spread over a total area of fully 100 square miles of territory. So rapid has been its diffusion and so destructive its effects upon alfalfa that in the fall of 1909 the governor of Utah appealed to the Secretary of Agriculture for help in the investigation of the pest and in experimentation, with the hope of finding some measures of relief. At the present time it is known to occur from Salt Lake City southward as far as Provo and northward probably to Ogden, as it has been found within a few miles of that city. It occurs westward to Tooele and eastward, at any rate, as far as Echo City. It will not be at all surprising if by another spring it is found in southwestern Wyoming, Southern Idaho, Nevada, and perhaps Colorado. The beetles have been repeatedly observed in cars on railway trains passing in and out of Salt Lake City. In one instance 27 were taken in the vestibule of one sleeping car on a train in Salt Lake City one day in July of last year, and have been found on freight cars within sight of the Idaho line. There does not appear to be any reason why it may not be carried in the same way over the San Pedro, Los Angeles and Salt Lake railroad and left in the alfalfa fields of Southern California, while by similar modes of distribution it may be carried by the Oregon Short Line railroad into Idaho and by the Union Pacific railroad eastward into the alfalfa fields of Wyoming and Colorado. It is within the range of probabilities that it may find an eastern outlet over the Denver and Rio Grande railroad into Southern Colorado and Western Kansas. When we come to take into consideration the fact that alfalfa escapes from cultivation, and in many cases grows as a weed along these railways and roadsides, we can well understand how easily these insects might be transported by the railways and, losing their hold, drop off along the way and find ample food in this alfalfa that has escaped from cultivation.

Besides railways, there is another

When writing advertisers, mention Cultivator.

Citrus and Tropical Fruits

"WITHER TIP."

By Prof. Ralph E. Smith.

Written Especially for the California Cultivator.

A casual mention of this subject made by the writer in a recent contribution to the Cultivator has excited so much interest that a more specific statement of our information and views along this line seems called for.

The "Wither Tip," "Anthracnose," or "Tear Stain Fungus" of citrus trees has been reported in probably every country where such trees are grown. Soon after his arrival in California in 1903, the writer found this fungus a common inhabitant of citrus trees in the state, but occurring manifestly only upon twigs and leaves which had first been killed or weakened from other causes. "Wither Tip" had therefore excited no interest or alarm over its occurrence.

In the winter of 1908-1909 there occurred in one of the largest and most important lemon groves in the state a large amount of a peculiar and unusual spotting of the fruit. The lemons, while still on the tree, showed an abundant sprinkling of small, red spots or dots over the surface of the exposed side, giving them a speckled appearance. In the curing house most of these dots remained practically unchanged during curing, while a few enlarged and turned black. Fruit thus affected while on the tree was mostly of the "tree ripe" or light green grade.

It happened during the prevalence of this unusual fruit spotting, that two well known eastern plant pathologists visited California, namely Dr. Albert F. Woods of the United States Department of Agriculture, and Professor P. H. Rolfs of Florida. Both gentlemen inspected this orchard and both suggested that the "wither tip" fungus might be the cause of this trouble, noting the presence of the fungus in the trees on dead twigs and sickly leaves. They were also of the opinion that this unusual attack might have followed an unusual abundance of red spider, the fungus gaining entrance to the fruit through punctures made by the insect.

The revival of the California lemon industry which has taken place during the last few years has been accompanied by a marked increase in attention to all things which affect the welfare of the tree and the quality of the fruit. Tree diseases and fruit blemishes which passed unnoticed a few years ago are now matters of the greatest concern to the grower. For this reason, the possibility of a new, serious citrus disease being present in the form of "wither tip" has aroused much interest. Many specimens have been sent to Washington and to Florida by various persons, said specimens having comprised diseased twigs and leaves, spotted fruit and fallen blossoms and young fruit, and in many cases reports have been received that the "wither tip" fungus was found in abundance about these specimens. Various reports and articles have been published upon the subject of "wither tip" in California, based almost wholly upon Florida experience and writings, and considerable apprehension and unnecessary alarm have been created thereby.

The most specific effects attributed to "wither tip" have been as follows: Killing of twigs and branches. Spotting of leaves. Dropping of leaves. Spotting of fruit on the tree. Spotting of fruit in storage or transit. Dropping of blossoms and young fruit. These effects are supposed to be most marked in the case of the lemon, quite common in the grape fruit and less prevalent in the orange.

Wishing to gain all possible information about "wither tip," the writer took advantage of Professor Rolf's presence in the state in 1909 to visit many lemon groves with him and have him point out the effects of the disease. The Florida expert found the fungus abundant in many trees, but in a manner which entirely confirmed previous California experience. Badly affected trees were in every case those which were already sick with gum disease or much weakened by drouth or lack of care. In such trees numerous dead twigs could be found, covered with the characteristic fungus growth, but such twigs would in every case have died in any event, "wither tip" or no "wither tip." In healthy trees there was no "wither tip," save in broken twigs or those which had been injured in some obvious manner.

The writer, therefore, remained in a very conservative frame of mind in regard to the injurious effects of this fungus, except in the case of the fruit spotting in the one lemon grove mentioned above. Largely on account of this case, a special investigation of the whole subject of "wither tip" was started, being carried on by Mr. C. O. Smith. At the same time investigations were carried on upon the general subject of the various forms of lemon blemishes and decay.

After a large amount of careful work, Mr. Smith reported that he was utterly unable to attribute any parasitic effect whatever to the "wither tip" fungus. After obtaining pure cultures of the organism from dead twigs and leaf spots, he tried in every conceivable way to infect healthy fruit and twigs. Innumerable quantities of spores, suspended in water, were sprayed over fruit and leaves with no effect whatever. Punctures were made into the rind of lemons on the tree and masses of the fungus inserted. Still no result. Young lemons and blossoms were sprayed profusely with spores; no effect as to dropping or in any other manner. Lemons covered with red spider were sprayed profusely with spores and no spotting produced. Such experiments were made in dry, wet, cold and hot weather; during rain and sunshine. Even under the most favorable conditions it seemed absolutely impossible to reproduce the effects attributed to "wither tip."

Desiring to leave no uncertainty in the matter, the writer sent to Cornell University for the most competent graduate in plant pathology whom they could supply to reinvestigate the subject. In this way Mr. C. N. Jensen was secured and, after studying the problem for several months, he entirely corroborated Mr. Smith's conclusions. After Mr. Jensens' unfortunate departure from California to another position, "wither tip" and other lemon investigations have been continued by Mr. Smith, Mr. A. R. Tylor and, to some extent, by Dr. J. E. Coit. The conclusion of the whole matter is as follows:

The "wither tip" fungus is abso-

When writing to CULTIVATOR advertisers **BE SURE** to say where you saw their advertisement. It will cost you nothing and **MAY** do you some good.

lutely not a parasite on healthy citrus trees or fruit in California.

On diseased or much weakened trees, on trees which have received any injury or sudden shock, such as might produce gum disease, dropping of the leaves, die back, or any other diseased condition, on branches or leaves burned by fire, fumigation or in any other manner, in cases where frost injury has occurred, on leaves, blossoms or fruit removed from the tree and partly dead, on fruit weakened by too low temperature in cold storage and, in short, on any citrus tissue which is dead or nearly so from any cause, the "wither tip" fungus is very likely to occur.

This, we fully realize, does not explain the fruit spotting referred to above, many forms of die back and tree disease, "red rot," "peteca," "russeting" and other fruit blemishes of the lemon and various other important questions. Information is developing along some of these lines. The purpose of the present article is simply to allay the unnecessary alarm which has been unwittingly caused upon this subject. We, above all, do not wish to criticise or make light of the work and opinions of others or to discourage its continuance.

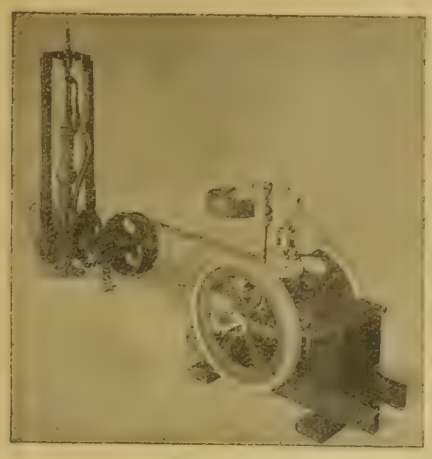
IN FLORIDA.

The citrus season of 1910-11 is over, though there are still a few grapefruit to go forward. It has been a fairly successful season, and wonderfully so, when it is considered that California had such an enormous quantity of fruit to market. If California had not started her advertising campaign a few years ago all oranges would have sold low, and we might have had a disastrous season.

We can afford to follow in the way shown by California and some advertising of Florida fruits will be undertaken next season. By a rising vote a considerable number of growers of the convention expressed themselves as willing to be assessed five cents a box for advertising purposes. There is no intention of proposing any such tax, and the exchange officials want it understood that there is not. If the exchange growers show a willingness to be taxed one-half that sum per box no doubt it will be done. This would raise a sum of over $35,000 on exchange fruit alone, It seems a pity that no progress has been made toward forming a non-partisan league of growers that would take in all factors, so that the assessment might be less, while at the same time much more money could be raised.

As it seems more than probable that the exchange will have to go it alone it would be in order to look for a distinctive brand to cover all exchange brands and readers are invited to send in their ideas. So far, the names most favorably considered are "Drinket," "Sweetheart," "Juicee," "Juicifruit," and Florafruit." It is considered essential that the name be distinctive of the juiciness of the orange, and the exchange officials believe that their campaign slogan will need to be "Drink the Juice." Send in your ideas.

We do not have to point to California any more to establish the fact that the good pack brings the money. We did have to point to California at one time. Now, there are some Florida brands that are head and shoulders above all the rest. Every association can be in the A class if it will. A fairly good equipment is needed, but what is needed most of all is a packing house foreman who knows his business, and who has not learned it all. Mr. Burton cited the case of a man whom he called a "Cracker," a man who had been packing oranges for twenty-five years. He thought at the time that he knew a great deal about packing fruit, but still he was willing to learn if he could be shown. He was shown, and now his brands are ranking right up with the leaders, and this man now acknowledges that he has lots to learn yet, and he proposes to learn it. It is really refreshing to note this man's enthusiasm and to observe the way he is always looking for points to make his force more efficient, and to do away with the rough handling of fruit. His pride has been aroused, and he proposes to be right at the top and leading if there is any way to get there.—Florida Grower.



The **Puritan** Engine
is built like an automobile
Engine
and unlike other small low-priced engines is
Fully Guaranteed
by the manufacturers. In order to do that they must and do build this engine with the same care as any of the well-known Z-S Engines, from 2 to 30 Horse Power. The **Puritan** is always on the job, it does two men's work with a boy's help—for 10 cents.

NOTE—
The **Puritan** is aircooled—no water to bother with.
The **Puritan** is a four-cycle engine—that's the kind to get.

Deciduous Fruit Culture

COUNTRY LIFE CONFERENCE.

The State Country Life Commission held its third session in San Francisco recently, and completed the general outline for the program of the delegate meeting to be held at Davis Saturday, Oct. 14th. We state a delegate meeting, because at one of the former meetings held in Sacramento the Commission decided that it ought to be a delegate conference, representation as follows: One delegate with alternate to be invited from each local Grange, Farmers Union, Farmers Club, Chamber of Commerce and Board of Trade, and one each from the five districts of the State Federation of Woman's Clubs, also each county superintendent or one appointed by him. The Davis conference occurs during the short course sessions which secures reduced fares on the railway.

The point of making it a delegate conference is to cause delegates to attach more importance to it and be present. Of course the program as yet is in merest outline, but the forenoon session calls for an address by Professor Liberty H. Bailey, if he can be secured. A conference as to what is being done in redirecting rural schools of this state through the University of California, normal schools, State Superintendent of Public Instruction and County Superintendent, will be held.

Luncheon will be served in the University Farm dining hall and the afternoon program will be about the tables. The commission urges that the important points to be attained by the conference are: (a) Interest farmers in general in redirecting rural schools and especially county superintendents, teachers and trustees; (b) More supervision of rural schools, at least one supervisor of agriculture in each county within the next five years; (c) How best to utilize county trustee conventions as provided for by law of 1911, in promoting the redirection of rural schools; (d) Increased opportunity for teacher training for argiculture; (e) Induce teachers to spend (live) whole of term in school community and enter into community social activities; (f) Make school the social center of community, if other good center not provided; (g) How to better utilize men and publications of University, Normal Schools, State Superintendent's office and other public agencies; (h) Show close connection of education with economic success.

DESIRABLE EARLY PEACH.

We recently had the pleasure of sampling a new peach grown at Gilroy, which if properly exploited will, we believe, be extensively planted. It is a cling, early variety. The flesh was yellow and the blush and general appearance magnificent. The peach was sent to us by Mr. Max J. Crow of the Santa Clara Nurseries at Gilroy, and regarding it he says that "it originated as a chance seedling in this locality. The tree is now ten years old, a strong, thrifty grower, has never curled and is a regular and heavy bearer. The fruit ripened this year immediately following Alexander; a few of the new sort were picked with the last of Alexander from an adjoining tree."

A NEW PLUM.

We have received from Mrs. L. Yates of Elsinore samples of a plum which she says is a hybrid of the Wild Goose and the Kelsey and which she considers superior to either of the parents. She thinks the tree from which they were taken is the only one of its kind. The fruit is shaped like the Kelsey, is two to two and a half inches in diameter, some being a light red and others showing a greenish tinge on part of one side, soon turning to a blush which ends in a deep red on the outer side. Their eating quality is of the best.

THE VALUE OF GREEN MANURES.

The plowing under of a luxuriant green crop of alfalfa, clover, field peas or vetches, which might be harvested and sold, or used as feed, seems "against nature." Perhaps it is for this reason that it is comparatively little practiced. Nevertheless a greater gain may often come from plowing under than from harvesting.

Dr. Cyril G. Hopkins, of the Illinois Station, in comparing green manures with farm manures, makes the following significant statement: "As an average, animals digest and thus destroy two-thirds of the dry matter in the food they eat, so that one ton of clover hay plowed under will add as much humus to the soil as the manure made from three tons of clover hauled off and fed, even if all the manure is returned to the land without loss by fermentation."

Prof. Marshall, of the Colorado Agricultural College, says of the addition of green manure to the soil, that it

1. Increases its fertility by the large amount of organic matter which it acquires.

2. Increases its water-holding capacity.

3. Utilizes soluble plant food that would otherwise escape from the soil.

4. Brings plant food from the lower soil to the surface soil.

So far from being "against nature," this method is but following the lead of and improving upon the method adopted by nature in preparing the land for the occupancy of man. To form humus, she has allowed countless forms of vegetation to grow and decay unused; and in the process, half or more of the humus-forming and fertilizing elements have been lost,

Get Oversize Tires

Avoid Blow-Outs—Save Overloading

Goodyear No-Rim-Cut tires—10% oversize—cost no more than tires that rim-cut, or tires not oversize.

The sale of Goodyear No-Rim-Cut tires has multiplied six times over in the past two years. Over 600,000 have already been sold.

Sixty-four leading motor car makers have contracted with us for these tires. The demand from users is now so great that our mammoth factories run night and day.

This patented tire has become the sensation. It is saving millions of dollars to motor car owners. It is a tire that you should know.

No Hooks—No Bolts

The No-Rim-Cut tire has no hooks on the base. No tire bolts are needed to hold it on.

Into the tire base we vulcanize flat tapes made of 126 braided wires. These make the tire base unstretchable. The tire can't come off because nothing can stretch it over the rim flange. But when you remove one flange, the tire slips off like any quick-detachable tire.

This braided wire, flat tape feature is controlled by our patents. It is the only way known to make a safe hookless tire. That is why other tire makers still recommend the old-style clincher tire.

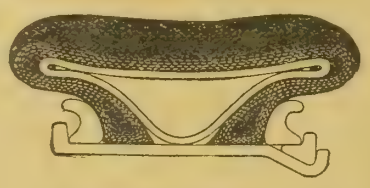
10% Oversize

The No-Rim-Cut tire, where the rim flanges flare outward, can be made 10% over the rated size and still fit the rim. And we give you that oversize without extra cost.

That means 10% more air — 10% greater carrying capacity. And that, with the average car, adds 25% to the tire mileage.

This oversize takes care of your extras—top, glass front, etc. It avoids the overloading which causes blow-outs on nine cars in ten which have skimpy tires.

These two features together—No-Rim-Cut and oversize—will under average conditions, cut tire bills in two. Yet these tires cost you nothing more than other standard tires. Do you wonder that men who know these tires insist on getting them?



The No-Rim-Cut Tire

This tire fits any standard rim. Simply reverse the removable rim flanges—that is, slip them to the opposite sides. They will then curve outward, as shown in the picture above. The tire comes against a rounded edge, and rim-cutting is made impossible.

Ordinary Clincher Tire

In the ordinary tire—the clincher tire—the removable rim flanges must be set to curve inward. They must grasp hold of the hooks in the tire base, to hold the tire on. Note how those thin flanges dig into the tire when deflated. That is the cause of rim-cutting, which may wreck a flat tire in a moment.

GOODYEAR
No-Rim-Cut Tires

Our latest Tire Book, based on 12 years spent in tire making, tells many facts which motorists should know. Ask us to mail it to you.

which are saved by plowing under at the time when those elements are most abundant in the plants.—C. R. Barns, Minnesota University Farm.

Touching upon the application of nitrate of soda to soils in the spring when the action of nitrates is too slow for best results to the tree, Prof. Lipman does not fully agree with Dr. King in the possible danger of forming black alkali in the soil. He had knowledge of one tree on which 25 pounds of nitrate of soda had been applied every year for four years. Of course, 25 pounds is an excessive application, especially when it is considered that, as Prof. Lipman said, two or at least three pounds is ample for any one year's application. In theory Dr. King may be right, but in practice California fruit growers, especially orange growers who are compelled to use some quick-acting nitrate, will continue to use nitrate of soda. Prof. Lipman's idea is, however, that caution would dictate using nitrate of soda simply as a supplement to the ordinary applications of this necessary element of plant food.

THE ALFALFA WEEVIL.

(Continued from Page 75.)

possible means of dispersion. The beetles may, like those of some of the eastern species, be washed into the tributaries of streams and, floating down, become established in alfalfa fields along their borders.

It must not be inferred from what has been said of this migration that all of the beetles leave the alfalfa fields in summer. It seems that these voyagers constitute only what might be termed the overflow. Vast numbers remain in the alfalfa fields, and while they do not eat the crown of the plant, as do the larvae or young, they gnaw off and devour the outer surface of the stem, thus skeletonizing and killing the plants, giving a field thus attacked much the appearance of having been scorched by fire. If at this time a field is mown off, or when the plants have all been destroyed, leaving no more food for them, the remainder move out of the field, evidently seeking new food supply.

Future Investigations.

The pest has become established in the midst of the alfalfa region of the West, where this is by far the most important crop grown. From what is known of the insect in Europe, and in the light of its behavior since its discovery in this country, there seems little hope for anything from it but dispersion and destruction. It has no natural enemies except frogs and toads, both of which are by far too few in numbers to restrict its ravages to the slightest degree.

The Utah Agricultural Experiment Station during the season of 1910 carried out a great number of field experiments with different methods of controlling the weevil, but none of these has so far given entirely satisfactory results. Besides, measures that are practicable in one locality may be impracticable in another.

It would seem, therefore, that the efforts of the Bureau of Entomology should be, first, to endeavor to restrict the pest as effectually and as long as possible to its present area of infestation, and, second, to use every means in its power to control it, in the meantime, within this area. In the first instance, the bureau experts will have the co-operation of the Utah Agricultural Experiment Station, as during the past year (1910), but in the very important part of this work, namely, the introduction and colonization of natural enemies, both native and foreign, the Federal authorities can treat the infested section as a whole, regardless of state boundaries, and thus work without handicap.

Quarantine between the states is, in the case of the alfalfa weevil, wholly useless on account of the agency of the railroads and winds as factors in the dispersion of the beetles. There is danger of dispersion in shipments in interstate commerce, but in the case of what is perhaps the most dangerous medium, that of baled hay, owing to the ravages of the pest, the movements of shipments are fortunately toward instead of from the infested area. As to other articles entering into interstate commerce, it would be impossible to guard against the beetles concealing themselves in almost any sort of a box, bale, or package of whatever shape, size, or nature.

The most inexpensive and practical means of controlling introductions of the pest by railroads appears to be in the close surveillance of the railroad right of way and the stamping out of incipient outbreaks as soon as discovered. This, too seems a duty likely, at least for the present, to devolve upon the Federal authorities, as nearly all of the states adjoining Utah are without the means of carrying such a plan into operation, and a year at least would be required to put into operation the legislative measures necessary to meet the situation. Therefore, the greatest assistance can be afforded by the growers of alfalfa personally, especially along railways and near towns and villages, by keeping close watch of their fields and promptly notifying the government or state authorities of the occurrence of any insect resembling this alfalfa weevil, as described and illustrated herein.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

REGISTRATION.

By Mrs. M. E. Sherman.

The value of a registration paper is in the fact that it shows the inheritance of the animal all to be in the one direction. Each individual, be it man or beast, in this world of ours has been found to be the sum of the individual ancestors that have gone before. To this is added the physical being the individual builds up for himself. Among the cows the dairyman makes them long milkers by care in handling. If he wished cows to milk three months he could readily have them the same as those that never go dry. The cow that is smooth and carries no rough bones is as easily bred as the deformed ones. It happened that some good milkers had great high backs and these were selected on account of their superior milking qualities, as the dams of the sires to head other herds. Then came the idea that because a certain number had this mark that it was a milk mark. It really was merely a mark of certain inheritance.

Marks.

I had a cow that had a round circle of white in the clear black. This mark persists and every now and then a calf in the sixth generation, is dropped showing it. Now had I thought this mark a reason for superior butter-making qualities of the old dam, it would have been easy to have bred for it. The value of a fine form is brought out by the prize ring for cattle. It is often said that the best cows as dairy animals never win in these contests that are not decided on the contents of the milk pail. The cows that do win, of course are good milkers, but when it comes to highest production nature seems to sacrifice the looks a little. Now when we attain the highest degree of skill in breeding we will have the perfect form with the greatest production in the same animal.

Value.

I have now four letters that show how little people realize the value of the registration papers of an animal until they come to sell it. These papers are as valuable as the deed of the lot you own. They are the cow's title to its rights as an animal of property, the property of being able to transmit to the calves the dairy qualities. The value will come in increased returns of butter and milk. Now if any one tells you an animal is pure bred and bred by such a breeder, ask for his papers and do not pay the price of a pure bred animal without the papers. If the animal has not its certificates it is only worth the amount of milk it will give, if a cow, and if a male, it is only worth its value in beef. If every one would recognize this fact it would cut off much knavery.

Facts.

I clipped from a paper an advertisement of a Jersey cow, four years old for sale as bred by me. I have not owned a Jersey cow since 1890, so if this cow was ever bred by me she must have been old enough to vote. Another woman writes she has a cow of my breeding, purchased in a southern county and gives a name, asking me to send her registration papers for this cow. As the name given was never used on the cow it was not possible for me to trace this animal. The writer felt abused and came back with a reply that the cow was a beautiful red and white one and the seller assured her was one of my best. I could only reply that I did not have any red and whites nor were they eligible for registration. Another trick I have had to meet is that the seller of cows will claim that the breeders agreed to, but did not furnish, the papers.

Many papers are lost by the careless people that receive them. It is not uncommon to receive letters from people declaring they never received the papers mailed to them. The return registration receipt signed is then brought out to show who has been careless.

Breeders.

I believe the longer a breeder is in the business the more careful he becomes with his books. A single mistake in an entry makes so much confusion that one learns that as soon as a calf is dropped to get its drawings and photographs, making entries in books of both and then tag the calf and get cow's description and number before the calf is twenty-four hours old. The herd books may be called for at any time by the association and must be in order. Every animal not in the herd must be accounted for and if dead, her papers are stamped with that fact. The fullest details are kept of the calves, their number, date of birth and any other facts. When you have registered animals it is necessary by law to keep a herd book, everything should be on these herd books and then the certificates should be locked in a fireproof safe, as they are titles of value.

Fads.

The association merely registers the animals and yet, while all are pure bred that are on the books, fashion has much to do with the prices. From a breeder with a reputation, cattle are worth more in selling than the same blood in animals that may have had to rough it for themselves. Yet again, an animal may be too highly bred to be of use to the ordinary dairyman. That is, her value as a dam of sires, may be too great to make her pay interest as a milk cow. It would take a mighty good cow to pay interest in milk on the prices often asked for them. One of the funniest things I know of in this way was a Mr. Newly Rich, who went to a sale of fashionable beef cows to buy an animal and brought home a Duchess cow, staked her on his lawn in front of his suburban home. She cost him some twenty odd thousand dollars and never gave a drop of milk, or dropped a calf. She soon became the torment of the neighborhood, for others preferred red roses to red cows on their lawns. The cow did not care whose lawn it was she trampled over every time she strayed from home.

Now as to cows being too good for people. I have a letter asking the price of a cow that will be guaranteed

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

to give ten gallons of five per cent milk for ten months in the year. I should like to see her! She should certainly be put into a glass case and have a silken halter and a golden manger. Nothing could be too good for her use.

CALIFORNIA BERKSHIRES.

By Harry L. Murphy, Perkins, Sacramento County.

Will you kindly give me space in your valuable paper in behalf of breeders of registered hogs in California. Professor Phillips of the University Farm at Davis has made statements which need correction. In a letter of March 13th which was addressed to Mr. W. E. Wintringham, a breeder of California Tamworths, he says: "As you no doubt know, there are only a few pure bred hogs of any breed in this state." Again in another letter dated June 19th to Mr. Wintringham, the Professor again knocks California pure bred hogs: "I have spent considerable time and money the last two years running about over California trying to buy some good breeding stock for the University. Good stock of pedigrees with individuality of the different breeds cannot be purchased at any price in California because it is not there to be had."

Now he may have traveled a great deal and found no pure bred hogs, yet I may say there are at least 200 head of registered Berkshire hogs alone, within 25 miles of the State Farm. These may be seen on the following stock farms: Grapewild Stock Farm, Sunnyside Stock Farm, Four Oaks Stock Farm and in the Brighton herd of Berkshires.

I know that Prof. Phillips has bought hogs which he has personally inspected and from a part of the breeders mentioned. There are a great number of other breeders farther away than these. The Columbia's model strain of Berkshire hogs have carried off more ribbons on the Pacific Coast than any other strain, and they were all raised in California. I have a litter of pigs farrowed Jan. 3rd this year, one of which weighed 213 pounds on July 5th, not bad for 6 months and 2 days growth. Also have one sow which weighed 390 pounds July 5th when she was one year and one month old, and I am not afraid to put her up in any show ring in company with any Berkshire on earth. I have several more excellent hogs, as have many of the other breeders of pure bred Berks. I am frank to say that the breeders do not like to sell to the State Farm because it generally takes a year or more to get our pay.

Let us hope that Prof. Phillips will attend the State Fair next month and see some good California bred hogs. We believe that he will see his mistake.

While in San Luis Obispo recently we had the pleasure of a visit at the place of Miss B. A. R. Stocker, a little one-acre ranch which she has named "Little Intensity." Every foot of it is given up to intense culture, not the least intense of which are the small goat pens at the rear, in which a few fine Toggenburgs are kept to supply milk for some of the neighbors. One valuable young doe, Nasula, was near kidding time, and Miss Stocker writes us that this doe has now brought forth two valuable youngsters, one a little hornless buck with wattles, so much like a Collie puppy that she calls him "Shep." The little doe was a disappointment in that Miss Stocker has an ambition to breed to the red color as she believes it an indication of one of the best strains of the milch goat. This proves, however, to be a pale gray with dark markings. The nanny is giving 4¾ pints daily, good for a yearling.

By furnishing the pigs with plenty of pasture we can produce an even gain on a small amount of grain-food and save a lot of fertility.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Itch.

A mare seven years old has the itch badly. She is getting in bad shape. Some places on her back and sides have become sores as a result of rubbing herself, or the medicines used.—Subscriber, Holtville.

Mix freshly slaked lime 10 ounces and sublimed sulphur 16 ounces. Add the mixture gradually to one gallon of boiling water; boil one hour, cool and pour off the clear brown liquid. Dilute with two parts of water or mix with an equal quantity of linseed oil and apply to the affected parts once every three days. Before using scrub the parts with warm water to remove all dry scabs.—F. G. M.

Collar Gall.

A mare in fine condition has a collar gall on the point of her shoulder. Pressure was removed by cutting a hole in the pad. Later she was laid off from work and the sore healed but as soon as we began to work her it returned.—Subscriber, Dey Rey.

Collar galls with thick callosities involving the skin and its substructures are difficult to remove without surgical interference. However, the patient daily use of a salve made of equal parts of oleate of mercury and lanolin rubbed into the lump may effect a cure in time. All pressure must be removed from the diseased region while the animal is working.—F. G. M.

CANE SUGAR AND BEET SUGAR FOR CANNING AND JELLY MAKING.

By G. W. Shaw, Univ. of California.

Chemists generally concede that the sugar which occurs in the sugar cane is identical from the standpoint of chemical composition and structure with that found in the sugar maple, sugar beet, and many other vegetable products. As it occurs in nature, the sugar is accompanied by various other materials dissolved in the plant juice, and it is the presence of more or less of such bodies which gives certain commercial sugar products, like molasses and maple syrup, their distinctive flavor.

Old-fashioned brown sugar, maple sugar, crude beet sugar, butternut sugar, and other similar sugars differ in appearance, flavor and palatability, owing to the character of the plant products which remain with the sugar, but from all of them it is possible to obtain pure, colorless crystals, like those called rock candy, identical in appearance, flavor and other characteristics. If the crystals are fine and separate, we have granulated sugar, while if they adhere in large masses, lump sugar, cube sugar, or loaf sugar results.

The cane sugar industry is much older than the beet-sugar industry, and since the days when the latter first assumed commercial importance there has been more or less popular discussion regarding the identity of the sugar from these two sources and regarding the relative merits for household purposes of the two sorts as they are found on the market.

It has often been said that beet sugar is not as sweet as cane sugar, notwithstanding the fact that chemists have known that, provided the two sorts of sugar are of equal degrees of fineness of granulation, and hence alike as to the ease or quickness with which a given quantity will dissolve, there is no difference in sweetness; for instance, when a spoonful is added to a cup of tea.

Another common statement is that beet sugar cannot be used successfully for canning, jelly making, and preserving. In earlier times, before methods of refining had been perfected, there may have been some warrant for such a belief, but methods of purifying beet sugar were long ago perfected and such sugar has been used for many years in this country and Europe for all household purposes.

In this connection, tests recently carried on at the California Experiment Station by G. W. Shaw, in which beet sugar and cane sugar were compared under factory and domestic conditions for preserving, are of interest. The fruits used in the tests, carried out on a commercial scale, were cherries, apricots, plums, peaches and pears. Each of these was preserved in syrup of different strength by the usual methods. In making the syrups used with the fruit some difference in the action of different grades of sugar was noted.

"The beet sugar caused the more froth in the making of syrup, but further investigation led to the conclusion that this was due to the fact that the granulation of the beet sugar was much finer than that of the cane, therefore causing more air to become entangled during the stirring than in the case of the sugar from cane. This was shown by the use of cane sugar of about the same granulation in another batch of syrup, in which the same frothing occurred as with the beet product. This has been noted in other instances, and canners are wont to count this against the beet sugar, but it is only the result of not comparing sugars of the same granulation. This difference in the action due to difference of granulation was the only apparent difference arising during the making of the syrup. This is not an essential difference between these sugars, however, as the character of the granulation is entirely dependent upon the wish of the manufacturer, the methods of boiling and granulation being the same in both cases. The sugar ordinarily used by the canners is known as dry, coarse, granulated, a grade which is not commonly made by the beet-sugar manufacturers, because there has not yet been the demand sufficient to warrant its production, but it could be made by them as readily as the ordinary granulation. After canning, the fruits were stored in cases in the ordinary way, the cans being opened from time to time to determine whether any change had taken place. Of the 2000 cans which were thus treated only six cans from the beet sugar lot and seven from the cane sugar lot spoiled during the two years, and these were evidently due to imperfect sealing of the cans, thus showing the utter lack of foundation for the idea that fruits do not keep well when preserved with beet sugar and that such sugar does not work well in the cannery."

In the household trials 40 per cent syrup was used and the fruits were put up in ordinary glass jars, 50 jars of both apricots and peaches being canned. "From these not a single can spoiled during the two-year period." The two sorts of sugar gave equally good results.

For jelly-making trials apples and currants were selected, equal quantities of juice and sugar, either beet or cane, being used and the mixture boiled until of the right consistency to jelly. "The product in each case was as clear as it is possible for jelly to be, and not the slightest difficulty was experienced in the making of it."

In connection with the experimental tests an attempt was made to trace numerous reports to the effect that fruit had been lost through the use of beet sugar in canning, but in no instance was this found to be the case, though numerous letters were received in reply to inquiries which were sent out.

"The utter folly of this idea that beet sugar cannot be used for canning purposes is further emphasized by the fact that practically all the sugar used in Germany and France for the purpose of canning and preserving is from the beet, and for many years American refined beet sugar was used without complaint in this country, because the mass of the people were not aware that it was derived from the beet. This sugar was brought here as raw sugar from Europe and refined at American refineries."

Professor Shaw concludes from this experimental data and other evidence that under both commercial and household conditions beet sugar and cane sugar give equally satisfactory results for canning fruit and also for jelly making.

COOL WATER IN THE HOT SUN
"No, Mr Sun, You Can't Warm The Water In The APPELL WATER BAG"
APPELL'S
SOUTH AFRICAN WATER BAG
THE ADAM APPELL CO.
PORTLAND OREGON

APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

STAR PORTABLE DRILLING MACHINES

More Profitable Wells

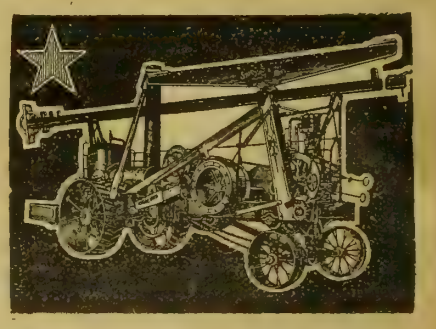
Can be drilled with the right machine. In buying a Drilling Machine, the first vital point is to be sure it will yield you the greatest possible service—and hence the greatest possible profits. You *must* know.

Star Portable Drilling Machines

have stood the test for years in comparisou with all makes, and the very fact that fully 95% of all Portable Machines now at work in the Oil Fields are Star Machines is all the proof necessary as to their superiority for all kinds of Well Drilling.

Drilling Machines,--Engines,--Cordage,--Etc.

STAR DRILLING MACHINE CO.
225 Palmer St., Akron, Ohio.
Branch Office Los Angeles, Cal.



Redwood Tanks

I sell direct to the consumer. This means a saving to you of about 10% to 20%. The agency plan is expensive to the consumer. Redwood Tanks, Picking Boxes, Drying Trays, Grape Stakes, Egg Cases.

R. F. WILSON Tank Mfr., 447 W. Main, Stockton, Cal.

Genasco

the Trinidad-Lake-Asphalt Roofing

You get real roof-economy in Genasco—not in substitute "asphalt", coal-tar, or composition roofings.

The **Kant-leak Kleet** makes seams absolutely watertight and prevents nail leaks.

Write for the Good Roof Guide Book and samples.

The Barber Asphalt Paving Company
Largest producers of asphalt, and largest manufacturers of ready roofing in the world.

SIXTH INTERNATIONAL DRY-FARMING CONGRESS.

By G. W. Shaw, Univ. of California.

The writer, as a member of the executive committee, desires to call special attention to the meeting of the International Dry Farming Congress, to be held at Colorado Springs, Colo., October 16-20, inclusive. Inasmuch as a large proportion of the arable land of California must always be farmed under conditions of limited rainfall, it is extremely important that there should be a good representation from this state at the next congress. The movement is an international one and all foreign countries, having similar conditions, will be well represented by official government delegates.

Every country in the world has a certain percentage of agricultural acreage for which there is either limited rainfall or limited moisture in other forms. To solve these problems is the work of this great co-operative congress, and you are urged to consider this convention of the utmost commercial and social importance to your country, commonwealth and associates. The program will be devoted to discussing plans for rapid enlargement of the necessary agricultural propaganda; co-operative work between nation, state and farmer in developing a higher type of methods and production; exchanging reports between nations, states and farmers, as to methods of overcoming problems in the conservation of moisture, soil fertility and of breeding more drouth resisting plants and fruits; studying the rebuilding of soils and overcoming of diseases of plant life, trees and soils, enlargement of experimental methods; national and state legislation affecting the farmer from the standpoint of development and methods; immigration; the interests of the homesteader, etc.

The program will be so arranged that delegates may have ample opportunity to visit the exposition and other attractions. At least one evening will be devoted to amusement and two evenings to joint sessions of the Dry Farming Congress and the Congress of Farm Women. The international section will be addressed by scientists from many nations.

The live issues of the day in the agricultural world will be discussed by leading thinkers and experimentalists, and no feature of practical farming will be omitted in the arrangement of the sessions.

Technical matters will be treated in reports made to the congress by special committees appointed by the president of the congress to carry on investigations, and to formulate future plans and advice for the benefit of members of this congress. Institute sessions will be arranged for in charge of various states each day.

An educational magazine is issued once each month by the Dry Farming Congress. Hundreds of valuable articles by the world experts, by practical farmers and special writers are published throughout the year and reports are given from hundreds of farmers through the statistical department. This magazine is sent to any address for one dollar per year.

This is one of the world's great movements, having in view the betterment of agricultural conditions, and California should be well represented.

The San Jose Grange discussed the fruit condition at its last meeting, and it was reported that some sales of apricots for as high as $60 had been made to canners. Seventeen cents for dried cots is already quoted.

A SURE METHOD OF ERADICATING JOHNSON GRASS.

Mr. C. R. McBride of Solano County, sends out the following method of Johnson grass eradication:

When a man who has a piece of land infested with Johnson grass is told that he can get rid of the pest in one year at a reasonable expense, he is liable to disbelieve the statement. It is true, nevertheless, and absolutely so, excepting, of course, infestations along creek banks and other trying situations where the pest will have to be handled in a different manner than the one under discussion.

The eradication of Johnson grass is based upon the following facts:

1. Plants must have light.
2. Plants must have food from the air, which is taken in the form of carbon dioxide.
3. It is the purpose of all plants to reproduce themselves.

Keep the plant (Johnson grass) from the light and air, and prevent it from seeding, and it will die.

The method is as follows: Plow the infested piece in the middle or last of May, depending on the time that the regular spring plowing was done. Plow again in the middle or last of June. The land should be harrowed after each plowing. The purpose of these plowings is to keep the plant from light and air and to keep the soil loose for the final plowing which should be done in the middle of August. This month is the hottest and drying time of the year and is the most effective time to disturb the roots. It is also the time of ripened seeds, if the plant is let alone, the time that the roots go into the dormant condition to rest, their purpose being accomplished. But due to the two previous plowings the roots will not be dormant at this time but will be striving to reproduce seed, will be overworked and very susceptible to a disturbance at this time.

The foregoing statements which I have made are based upon the practical experience of Mr. G. W. Long. By this method he eradicated two acres of Johnson grass in a vineyard in one year and is willing and able to prove it to any one who is interested enough to inquire. The cost will not be over $8 per acre in an orchard or in vacant land, although in a vineyard it will be a little more.

EUCALYPTUS PLANTING.

Giving information as to the planting of eucalyptus trees in San Luis Obispo County, Mr. George F. Bigger of Nipomo writes:

"During the past two years the planting of eucalyptus trees, blue gums, has been very extensive in this section. More than 7000 acres in tracts of from 40 to 1000 acres have been planted. These are situated between Oceano and Nipomo, and indications are that there will be as much more planted during the next two years. The rainfall here is about 30 inches, the soil sandy, and the moisture from the heavy fogs, makes this an ideal situation for the blue gum. Trees four years and four months old show a diameter of 11 inches one foot from the ground, and trees one year and four months old are 4½ inches in diameter. The usual distance apart is 8 by 8."

The Lemon Men's Club surprised one of its members, Mr. A. F. Call, of Corona, with a check for $6,000 as a token of appreciation because of his magnificent fight in the lemon rate case before the Interstate Commerce Commission.

MEXICAN LAND

The war is over and conditions have returned to normal.

Land on the West Coast of Mexico is the best investment on the market to-day. They are the only really fine lands within the reach of American Markets that can be had at low prices.

Let us send you our State of Sinaloa Booklet. It is beautifully illustrated, and contains just the information you want.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

The proceedings of the 1910 session of the Farmers National Congress held at Lincoln, Nebraska, now being mailed, contains the important addresses on agricultural topics. The next session will be held at Columbus, Ohio, beginning October 12th.

CONTINUE THE DEMONSTRATION TRAIN.

Prof. Warren T. Clarke, in charge of the university extension work through the demonstration train service, has the matter of the coming year's train under advisement. It has been found that the demonstration work has drawn heavily from the teaching force of the agricultural department, yet the work accomplished has been of great importance and the Southern Pacific still stands ready to continue the train service if the university people can join in it, so that it is probable it will be taken up again this fall. The first train usually starts through the Sacramento valley during the last of October or the first of November.

Prof. Clarke says a number of changes are in contemplation, if the service is continued. Each year it has been extended, until last year when the train reached its limit, as it required ten or twelve coaches to accommodate the immense number of exhibits prepared. Probably the work will be more specialized and instead of encouraging school children and an otherwise large attendance, the effort will be to encourage only those to attend who will gather a fund of information. To that end, instead of filling the cars with exhibits, and the crowd passing through quickly, merely gazing at the mass of exhibits, only about half of each car may be filled with exhibits and the rest will be provided with seats so that those interested may be seated and listen to general lectures, the exhibits being used to enforce the lessons. In addition, a longer stop will be made in each community, giving more opportunity for real study. The management feels that the trooping of school children through the cars has reached almost an abuse.

WHAT DO YOU THINK OF THIS?

We have received a pamphlet giving description of a new and useful system of irrigation through producing artificial rain. It is declared to be indispensable to gardeners, farmers, and others. It is patented in the United States, England and foreign countries. The following statements accompany the pamphlet:

"My artificial rain system has demonstrated by practical tests in the Argentine Republic during several years, that by its use, crops may be doubled, and with my electrified water as fertilizer, they may be trebled. The ravages by locusts can be prevented, and these pests completely destroyed by the use of my invention. Crops cannot be damaged by frosts where my system is in use."

Unfortunately the experiments have all been performed in Argentina, which is too far away for verification of the statements made. The electrified water as food and the absolute prevention of frost certainly looks good. We may yet be raising bananas at the north pole.

INTERNATIONAL INSTITUTE OF AGRICULTURE.

The results accomplished by the International Institute of Agriculture, particularly through its bulletins of statistics, call for still better service, and this bulletin which has heretofore appeared monthly, will now issue an extra on the 15th of each month.

In the first of these mid-month supplements we note that the area of wheat to be harvested in France is 95.9 per cent of normal, while in Canada it is 113 per cent. The United States is also above normal, according to this bulletin, by 9.9 per cent. In Hungary, Italy and Sweden an average crop is expected. The indications the world over as to barley are that the condition of that cereal is good.

This Institute has not had the hearty support in this country which it should, but we believe that this great work which had its inception in the brain of a Californian will ultimately make good and our Department of Agriculture will make a strong stand in its favor.

A new bill has been introduced to the parliament of the Danish government which is intended to give a stronger position to the co-operative movements of that country which has been the most advanced of any in agricultural co-operation. There are now more than 3000 agricultural co-operative societies in that little country the total population of which is less than 2,500,000. Through these organizations, meat, bacon, butter and eggs have become articles of considerable export, increasing in value from 30,000,000 crowns a few years ago to more than 300,000,000. Heretofore there has been no special legislation touching upon co-operation excepting favoring formation of cattle breeding societies. The bill was introduced not so much because of actual need as to make the formation of co-operative organizations more effective; it also has to do with limiting liability.

"A farmer for every forty." Here is the slogan in certain sections of Michigan. Plans are being made for a great land and apple show to be held at Grand Rapids in November. It is proposed to make this one of the finest exhibitions of apples ever shown. One of the Michigan people is to attend the apple show at Watsonville to learn of what a big apple show consists. In addition to the displays of fruit, there will be lectures on scientific fruit growing and exhibits by manufacturers of orchard implements.

The management of the American Exposiiton of Dry Farming Products which will be held in connection with the sixth annual session of the Dry Farming Congress at Colorado Springs in October, is offering a long list of premiums for all kinds of products handled under dry farming methods. A premium to be named later will be given for the best collective exhibition of products grown on dry land in 1911 by a graduate, class of 1910, from the agricultural colleges of Arizona, California, or any state of the arid West.

Our readers of the live stock page will be pleased to see Mrs. Sherman's article after the long rest which she has had while in a San Francisco hospital. She is not yet fully restored to health but sufficiently to take up her Cultivator work again, and while she may not be regular for a time, will at least be with us occasionally and will be able to answer inquiries as to the live stock industry and also give information on vineyard questions.

President Stahl of the Farmers' National Congress is in receipt of a letter from the President's secretary, in which it is stated that "The President is strongly in favor of the establishment of a general parcels post, and will recommend the same without qualifications in his next message."

The elm is the most popular shade tree in Sacramento County.

The annual report of the California Development Board contains a great fund of information as to the productions of the state, statistics showing wonderful growth and making comparisons with other sections, with articles by such writers as Gen. N. P. Chipman, Samuel Fortier, John P. Irish and others. In the back is an excellent folder map of the state, to a certain extent a repetition of those appearing in former reports, one feature of which is a striking comparison of the size of California with certain Eastern states. One defect of this map, however, is that one of the counties of the state is ignored by oversight, that is, in the list of counties sending out horticultural products; in melons Imperial county is not mentioned. Any county which can send out a solid trainload of melons a mile and a half long, or during the season ship a total of two thousand five hundred cars of cantaloupes, is surely worthy of mention amongst the melon counties. We hope that by another year Imperial's importance will be recognized.

The special election held in Imperial to determine as to handling irrigation matters as an incorporation under the Wright-Bridgford Act resulted in overwhelming victory for the proposition. The vote stood 1,304 for the irrigation district and 360 against it. The one town of Imperial was almost unanimous against it, for outside of that place only 87 opposing votes were cast. The directors and officers for the first year are: First district, Fritz Kloke, of Calexico; second district, W. O. Hamilton, of El Centro; third district, H. L. Peck, of Imperial; fourth district, I. C. Pound, of Brawley; fifth district, P. N. Ferguson, of Holtville; for assessor, H. L. Barker, of El Centro; for treasurer, J. S. Brown, of El Centro; for tax collector, C. W. Collins, of El Centro.

Olive oil manufacturers of California missed the opportunity of their lives in not making a magnificent display of California oil during the recent convention of the American Medical Association in the city of Los Angeles. No such opportunity for publicity will be offered among people who are able to increase its use. We do not wish to give the idea that olive oil is of value only as a medicine or in case of sickness or when recommended by doctors, but that offers one opportunity for increasing its consumption which should have been grasped. So far as we know, not a single bottle of oil was exhibited, and the physicians returned to the East with no more knowledge of California oil and its purity than when they came.

The Los Angeles County Highway Commission, which has had to do with the making of the $3,500,000 worth of good roads, has issued an elaborate semi-annual report. It gives particulars as to methods of constructing the 307 miles of macadam highway authorized by the bond issue. The bonds were issued in July of 1908, but, owing to the difficulties of such extensive work, only about one-half of this mileage has been completed up to this time. Los Angeles county proposes having the finest roads in the world if money can procure them.

According to the last census, Colorado has 31,000,000 cattle, 27,000,000 horses and colts, and less than 2,000,000 mules. The total number of farms in the state is 45,839.

Agricultural News Notes of the Pacific Coast

Northern California

The arceage of almonds in Butte County was doubled this year.

Winters, Yolo County, has already shipped 200 cars of fresh fruit.

Vaca Valley claims the earliest shipments of grapes from the Sacramento Valley.

A Colusa farmer claims $2,000 net profit from ten acres under intensive cultivation.

The owners of 4,600 acres of land near Suisun will organize a reclamation district.

Farmers at Sebastopol, Sonoma County, are discussing the advantages of better roads.

A poultryman at Willows, Glenn County, claims a $10 a day profit from 1,600 laying hens.

The plant introduction garden at Chico has grown this season over 400 varieties of grain.

The Inter-County Good Roads Association was recently organized at Vallejo, Solano County.

The Gold Ridge section proposes to make its greatest show at the coming Gravenstein Apple Exhibit.

The Country Life Commission has called for a general delegate conference to be held at Davis October 14.

A Lake County farmer has invented a "submarine saw" for eradicating tules and other noxious water plants.

Farmers of Lakeport, Lake County, are discussing the advantages to that section of more perfect irrigation methods.

The Sonoma County Pomona Grange will hold its regular quarterly session at Santa Rosa this week. It will be an open session.

The Irrigation Districts Association recently met in Oakdale and discussed needs of districts formed under the Wright-Bridgford Act.

The California Debris Commission reports improvement in navigation and flood conditions of the Sacramento and San Joaquin Valleys.

Winters, Yolo County, now claims the record prize for a car of fresh deciduous fruit. The car was made of assorted peaches, plums and apricots and sold for $2,602.

The Sebastopol Apple Show Association, which opens its great exhibit August 14, will house part of its exhibit in the biggest tent in California. It is 110 by 260 feet.

On July 15 a fruit train out of Sacramento over the Western Pacific made Salt Lake City, a distance of 782 miles, in 35 hours. This was an average of 23 miles per hour.

An instructor at the State University is preparing to organize the teachers and children of the state to take up garden work. The Junior Argiculturist will be issued in aid of the movement.

Some stock breeders of the Sacramento Valley have complained because of the fact that the State University Farm at Davis has purchased pure bred stock for the uses of the school from outside the state. Superintendent Anderson says that while some stock has been purchased on the outside, more than 85 per cent of the funds have been placed with California live stock people.

Central California

Fresno ships its first car of fresh fruits this week.

Monterey has just opened a magnificent new library building.

Some Kings County vineyards are showing the attacks of erinose.

Merced County is planting more extensively of alfalfa than ever before.

Boys at Kerman have been arrested and fined fifty dollars for swiping watermelons.

Raisin growers are still firmer in their demand for a long price on the coming output.

The orange planting section near Exeter has been largely extended during the past season.

Fresno grape growers are discussing methods of securing sufficient help to market the coming crop.

The Kings County dairymens organization has recommended the appointment of a dairy inspector.

The Fresno Chamber of Commerce has passed resolutions endorsing the reciprocity agreement with Canada.

To handle the grain of Orris, Ducor, Terra Bella and Lois, Tulare County, there have been shipped 180,000 sacks.

The number of private pumping plants for irrigation has greatly increased in Fresno County in the last year.

The Kings County dairymen have organized for the sake of co-operating in producing better products and securing better prices.

The first annual show of the Santa Cruz County Poultry and Pet Stock Association was pulled off last week. Over 1,000 birds were entered.

Several grape pickers and packers, the latter mostly girls, have gone from Fresno to the Imperial Valley to assist in handling the season's output.

Turlock is planning for a melon carnival, at which cash prizes will be offered for the best productions of the Turlock Irrigation District. The dates are August 24-25.

Orange groves in the foothills of eastern Fresno County have used less water in irrigation this year than previously. More conservation is reported as the reason.

Sanger, Fresno County, has an alfalfa stalk which has grown seven feet and eleven inches high and has an extreme spread upon the ground of thirteen feet and nine inches.

A fruit grower at Del Rey, Fresno County, is experimenting with a fruit which he calls turanji, introduced from India, said to furnish a product equal to the candied citron.

A corps of students has been engaged in collecting specimens of mammals in the Sacramento Valley. Work was begun at Tracy and was carried on as far south as Bakersfield.

A conference has been called of irrigators taking water from the Tule River to meet at Porterville. The idea is to secure a universal agreement as to use of the waters of the river.

Raisin Shippers at Dinuba report the receiving of circulars from Eastern trade containing a veiled threat of boycott of California fruits if the producers see fit to take advantage of the favorable season to secure full prices.

Southern California

Orange County estimates 1,200 tons of dried apricots.

San Diego County is expending $1,250,000 on good roads.

San Diego has aspirations to be a great meat packing center.

Imperial Valley will make a great display of cotton at the coming state fair.

Carpinteria, Santa Barbara County, reports the largest walnut crop in years.

Orange County anticipates $1,800,000 from its sugar beet output this season.

Imperial Valley's acreage of cotton is about 16,000, and 10,000 bales are expected.

Wintersburg, Orange County, has already planted more than half of its celery crop.

The daily shipment of Valencia oranges is greater than ever before at this season.

The flow of water through the Imperial Valley canals is far greater than last year this date.

Apricot buyers are passing the word to the growers that they must dry their fruit "very dry."

The raising of bamboo for paper pulp has been suggested as desirable for the Imperial Valley.

Santa Barbara County's bean growers are discussing the advisability of joining the Ventura County association.

The plowing out of Ventura County's beets began last week near Oxnard. The factory started on Saturday morning.

The famous Warner Ranch in San Diego County, consisting of 60,000 acres, was recently sold for an even million dollars.

The Southern California sugar factory at Santa Ana began its third campaign last Thursday. About 65,000 tons will be sliced.

Ventura County apricot growers complain because of the very uneven ripening of the fruit. This will extend the season much later.

Ventura County's apricot output will be rather heavier than anticipated. The season was so late that the dry yards are yet busy spots.

Orange County's walnuts are in excellent condition, one of the biggest crops ever, and with promise of good prices the walnut growers are happy.

The eastern representative of the Lima Bean Growers Association has been in California, inspecting conditions and preparing for a big output this fall.

San Diego's exposition ground breaking ceremonies drew great crowds to that city last week, and an auspicious opening of her great 1915 show was held.

The contract for the sugar factory on the Irvine Ranch, Los Angeles County, has been let to a Cincinnati concern. The capacity of the factory will be 600 tons.

Imperial County feels greatly elated over the almost unanimous decision of irrigators to establish a Wright irrigation district for the control of the waters before handled by the California Development Company.

The Coast

Klamath Falls, Oregon, is planning for a water carnival.

Oregon flax is being exported to the linen mills of Europe.

Oregon shows a material development of the small farm.

Pear producers at Grants Pass, Oregon, are now receiving $1.58 per box.

Elgin, Oregon, proposes to devote much of its grain lands to apple culture.

"The wheat crop is almost perfect" is the report from Walla Walla, Washington.

Desert sections near Phoenix, Arizona, are being charted as an aid to travelers.

The Oregon State Medical Association is making a fight upon tuberculous cows of that state.

Eastern Washington will have a bumper wheat crop, even exceeding the big one of last year.

The cherry crop at Hood River, Oregon, is reported as having been exceptionally fine this season.

San Simon, Arizona, has a fine flow of water from artesian wells in the neighborhood of 500 feet deep.

Farmers at Ephrata, Washington, have subscribed $1,000 for preliminary surveys for a big irrigating canal.

A Wilcox County, Arizona, alfalfa grower will take 50 tons of alfalfa from 18 acres which was planted last fall.

One peach grower at Yakima, Washington, has used 18,000 feet of lumber this year as props for the overloaded branches.

The County Commissioners of Harney County, Oregon, have purchased 200 acres of land for an agricultural experiment station.

A "blue rose" much advertised at Pendleton, Oregon, has proved a disappointment to those who expected great returns from it.

Ranchers at Klamath Falls, Oregon, have decided not to wait on the reclamation service, but to handle their own irrigation problem.

United States land office at Burns, Oregon, has thrown open for settlement several thousand acres of government land in that district.

A permanent reduction on freight tariffs between Eastern Washington and Puget Sound points has been announced by the Great Northern.

The fruit growers association at Eugene, Oregon, is handling three cars of cherries daily. They are put in pickle for shipment to eastern confectioners.

Grain lands on the Lewiston-Clarkston project on the Washington side of the Snake River will have a record breaking grain crop this year, reported to be over 12,000,000 bushels.

Farmers of the Yuma Valley are having trouble with the city council of Yuma because of an ordinance compelling the farmer who would sell his own produce to take out a peddler's license.

The order of Elks of Phoenix, Arizona, recently made a visit to the East, and took back of the products of Arizona a feast of ostrich eggs to convince the Easterners that Arizona does things in a big way.

Pacific Egg Food

Makes hens lay; none better.
Good for molting time, too.

Special prices: 90 lb. sack, $1.75; 75 lb. sack, $1.50; ton, $37.50

Seed catalog "G;" Poultry supplies "H;" Which shall we send you?

WEST COAST SEED HOUSE

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

DUCKS.

Mrs. A. Basley.

A "Constant Reader" complains that ducks are being neglected in these columns and asks "Are not ducks more profitable than chickens?" and "What do you consider the best breed of ducks?"

Ducks have their own place in fowldom as they have in the market. They are not as popular for the table as chickens simply because we have not acquired the same taste for them, consequently in most places they will not be as popular as chickens.

Ducks should be properly cared for or not at all. They are easily raised in this climate, they have no diseases, never have roup, and are not troubled with lice or mites after they get mature plumage. They are easy to raise provided they have shade from the sun and clean water always before them, in a vessel sufficiently deep for them to immerse their nostrils. Ducks rinse out their nostrils many times a day and if unable to do this the nostrils seem to dry and a mucus forms at the top of the nostril and hardens and sometimes forms an abscess. The eyes close up, the duck becomes blind, cannot see the food and dies.

I have had letters from persons in trouble, thinking their ducks had roup. To one I telephoned "Ducks never have roup. Give yours a deep vessel with clean water and they will cure themselves." To another whose ducks were in a very bad condition I wrote that she would have to oil a feather and pass it carefully up the nostril so as to soften the mucus which had dried and hardened and to give the ducks a vessel deep enough so they can rinse out their nostrils. She wrote me a most grateful letter thanking me and expressing her great surprise that such a very little thing as that should make all the difference between failure and success. The little things count in this business.

Some people let chickens and ducks run together, feed together and house together. It is bad for both (and worse for turkeys). Ducks foul the water and this makes chickens sick. The chick feed of whole grain is unsuitable for ducks and they die of indigestion. One novice feeds wheat as long as the duck survives, another killed a first prize winner (imported) with whole corn, and a third lets the little fellows snatch a bite from the chickens provided they are quick enough. The result can easily be imagined, little stunted, hump-backed runts, whose beaks and feet have far outstripped their bodies in growth. There is neither profit nor pleasure in raising ducks by any such haphazard method. Aim at perfection and do not be satisfied until it is reached. It is just as easy to raise good ducks as good chickens, in fact, I think it is a little easier when one knows how.

Young ducks are large feeders but are cheaper to feed than chickens in proportion to their growth and weight. Whole grain should never be fed to young ducks. Ground grain is better for both old and young. Cooked vegetables thickened with equal parts of bran and corn meal is an excellent duck feed. If potatoes are used the corn meal and bran should be well moistened before adding to the potatoes. When dry meal is mixed with cooked potatoes a tough gummy mass is the result. The ducks may try to eat it, but a great part is shaken out of their mouths and wasted. The more watery vegetables when boiled, such as turnips, beets, cabbage or cut alfalfa scalded do not contain starch, like potatoes, and therefore no water need be used in mixing. Green food raw is a prime factor in duck feeding, as is also bran. Ducks require more green food than hens, and of course, alfalfa is about the best green food they can have. Water vessels should be scalded every day and fresh water given at every meal. Coarse sand or grit (chick size) should be before them always, also crushed clam shell when they are laying. I have found that nothing equals the small clams, crushed, to make ducks lay. These and the grit should be easily accessible but not mixed with the food except in the case of very small ducklings when it is advisable to add a little sand to the food. Ducks should be fed all they will eat, they will not overeat if the food is a properly balanced ration. A thin duck will never lay; they must be plump, and well fed. Ducks become very fond of alfalfa meal after using it a short time and it is excellent for them. A little salt may be added to the food occasionally.

Each variety of duck has its admirers. Undoubtedly the Pekin duck is the most popular breed in the large duck ranches of the East where thousands of them are fattened and turned off every season. Though the Pekin ducks may not merit all that is claimed for them by their enthusiastic admirers, it is certain that the duck business could not have attained its present proportions without the Pekin and that as a market duck in this country this breed takes the lead.

Personally I prefer the Indian Runners on account of their wonderful laying qualities. I had ten ducks of this variety that laid 2331 eggs in one year. I think the climate of California being semitropic, so nearly resembles that of India where they originated, that they lay better here than in England or the eastern states where the colder winter slightly affects the laying. The eggs of the Indian Runner are ivory white in color, much resembling Minorca eggs, very delicate in flavor. In England their eggs are greatly in demand in the sanitariums on account of their delicate flavor, richness and nutritive value and their absolute freedom from tuberculosis taint. The flesh of the Indian Runner is finely grained, juicy and resembles in flavor the much extolled canvasback duck.

There is a new duck which is at present hoping to quack its way into the American Standard of Perfection. It is the Buff Orpington duck. It is a breed of Mr. William Cook's making. He named them as he did the Orpington hens, after his own place in Kent, England. The color of these ducks is a soft shade of buff, the drakes having rich brown heads. The Buff Orpington has a good deal of the Indian

Runner blood in it, hence its fine laying qualities. A friend who has them straight from England writes that they even surpass Indian Runners. Hers commenced laying on their arrival in October last and have never ceased, eight ducks laying seven or eight eggs every day. These ducks weigh a pound and a half more than the Indian Runners, are larger and have a big amount of breast meat. They mature very early and are one of the best market birds, and Mr. Cook claims that they are better layers than any of the duck family.

The "Quackless" duck or the Muscovy is not largely bred in this country. They do not quack, but hiss like a snake and are pugnacious and ill-tempered. When young they are very quick and will climb up a wire fence with the greatest agility and run away as fast as quail. The middle toe has a hooked claw enabling them to climb and although they have webbed feet they are not at home in water, but seem to prefer dry land. When mature they are very strong on the wing, will easily fly over the barn and prefer to roost on the top of the house or barn, quite unlike other varieties of duck. They are natives of South America. There are two varieties, the white and the black and white. The males are much larger than the females. I had a drake that weighed fourteen pounds. They are very good sitters and the eggs take thirty-five days to hatch. Their peculiarity is that both sexes have caruncles at the base of the bill, these become larger every year, giving them a vulture-like appearance. They are of a different species from other ducks and it has always been asserted that they will not interbreed with any of our domestic ducks or with geese.

"The love of birds and trees is one of the healthiest emotions of the human heart. It may well be cultivated. There is no more innocent and no more gratifying source of enjoyment than intelligent interest in the beauties of nature. Learn to know the calls and plumage of our birds, the varying foliage of our trees; grow to love the quiet places where they may best be studied, and you will be happier and better citizens of our great state."—Governor Johnson.

Note the hens that have been especially successful in brooding and rearing chickens; don't sell them, even if not very great layers. Give the eggs procured from breeders to such hens; they will save enough chicks to pay for their feed through the winter.

Ducks can be successfully raised by feeding just a little wet corn meal five times a day, a little water five times a day, with grit and grass where they can get plenty. It is easier to overfeed than to not feed enough. A pint of corn meal a day is enough for twenty little ducks.

An observant swine feeder says the sows fatten easier and quicker, than the males, and isn't it so with poultry? Therefore the greater need of separating the pullets from the cockerels as soon as the sex can be told.

Scaly legs is a troublesome and loathsome disease, and is contagious. A mixture of kerosene oil, lard and carbolic acid if rubbed on the legs will soon cure this malady.

In the last twenty years imports of poultry to Germany have increased from $500,000 yearly, to $50,000,000 for the past year; this seems almost incredible.

POULTRY ITEMS.

No food nor nourishment about charcoal—not a bit, but it is a corrector that helps the chicks' digestion.

If you must feed soft food, for mercy sake provide a small trough in which to feed it. It becomes a starter of disease when thrown on the ground.

It is all right enough to rear turkeys with the chicken hen if the fool hen wouldn't wean them so early. Then lice are always more troublesome than with turkey hens.

Merely as a suggestion look after the cleaning and ventilating of the brooders and brood coops. As the chicks grow older it is essential to clean more often as droppings soon accumulate. Cleanliness and plenty of fresh air are great helps in developing the chicks and keeping them thriving and prospering.

Have you purchased a spray pump yet? You need one if lice are giving you trouble. One stands a poor show of seeing much pleasure or profit in poultry unless the lice pest is under control. It is very easy to stunt the growth of a flock of chicks by a little carelessness in looking after the lice question. Once the tiny mites get right numerous you have got trouble on your hands. Insect powder they don't mind a bit. Have to fight these torments by spraying or painting with a liquid lice killer. Strong salt water applied hot, or boiling suds are good remedies.—Successful Farming.

During hot weather shade should be provided for the young chicks, or the heat will kill them. If there are no trees, then shade in the shape of sheds should be provided, so the chicks can go in and out at will.

Get all of the manure out onto the land where it can earn something for you. It is useless in the yard.

A GOOD RECORD.

I have eight hens that were a year old June 15th and had laid to that date 1123 eggs, or three over 140 each. They began laying Thanksgiving week. In March, April and May they laid, respectively, 199, 196 and 202. I know this is a pretty good record, but I would like to know how good it is and if it is unusually good. Since April 15th they have been in a chicken yard with sixty young pullets, which I feared would affect their laying, but I guess it did not.—E. L. Shea, El Cajon.

* * *

The above is a good record and Mr. Shea may well have satisfaction in it. We will be glad to receive from him statement as to methods of feeding and care of this flock of birds. We doubt not there are many year-old hens which during their entire second year have made no better record.

Irrigation and Forestry

WATER REQUIRED FOR CROPS.

A fact of immense importance, especially in regions of scanty rainfall, or those subject to severe droughts, has been brought out by investigations reported by J. A. Widtsoe, of the Utah Station, as well as by the work of other investigators. Prof. Widtsoe found "that the amount of water actually required for the production of a pound of dry matter becomes smaller as the available fertility of the soil increases." He states that "this law is not new, but it does not seem to have been applied to the cultural methods in a country where the limiting factor is the water supply."

Prof. Widtsoe found that thorough hoeing or cultivation throughout the season increased materially the yield of dry matter and decreased the amount of water required per pound of dry matter produced, that resting the soil for several years had the same effect, and that on fertile soils the water requirements of crops would be materially lowered by the addition of manure or commercial fertilizers. He believes that in every case the result is to be attributed largely to the plant food set free by the hoeing or fallowing or that added in the fertilizers.

The practical conclusion of all this is simply that in districts where the rainfall is the chief consideration it is not sufficient alone to store an abundance of water in the soil, but the soils themselves must be kept in such a condition that plants growing on them can produce dry matter with the smallest possible amount of water. Under a system of dry-farm rotation, in which a hoed crop is grown perhaps every other year, in alternation with wheat, a fairly large amount of available plant food will be maintained, but at the same time the amount of stored moisture will be so near the danger limit as to jeopardize seriously the maturing crop. On the other hand, where the soil after being fall plowed and left in the rough throughout the winter is allowed to lie fallow the following summer, a much larger amount of plant food is set free, and at the same time a larger amount of water is stored in the soil. This combination of favorable conditions is much more likely to result in a profitable yield than can any system of culture which tends to weaken one or the other of these vitally important factors. In the Great Basin district, practical experience nas demonstrated almost beyond a doubt that summer fallowing is indispensable in successful dry farming. In fact, it has become a doctrine that if land at all adapted to dry farming is summer fallowed every other year a crop failure for want of water is impossible.

Dry farming lands are fallowed: First, to store in the soil the precipitation of two or more years; and, secondly, to set free plant food which will enable the crops to reach maturity with the smallest amount of water. This doctrine explains, undoubtedly, many of the successes and failures on dry farms. Numerous cases are on record where soils under a comparatively abundant rainfall failed to yield well, while other soils under a much smaller rainfall yielded abundantly. There are many soils the available fertility of which is so low that they must be carefully cultivated in order to set free sufficient plant food before successful dry farming can be practiced upon them. This is shown in lands that are allowed to lie fallow for a year after the first plowing before crops are planted. The extraordinary yields sometimes obtained on soils where the rainfall is twelve inches or less may be explained by the naturally large quantity of available plant food found in them.

The understanding of the relationship between soil fertility and transpiration is vital to dry farming, but it is also important to irrigation farming, especially in districts where the water supply is limited. If the irrigation farmer, either by fallowing or by proper manuring, maintains his land in a fertile condition, he will better meet seasons of drought or water shortage than his neighbor whose lands are in an unfertile condition. The principle here discussed must be incorporated into the practice of agriculture in arid regions.

In the Utah experiments it was found that corn required a third less water to mature a pound of dry matter on soil which had been manured or fertilized with nitrate of soda than on the same soil without such treatment.

The important lesson from this work, briefly stated, is that if the farmer wishes to conserve a scanty water supply and use it to the best advantage in the growth of crops, he must keep his land rich.—Bulletin 435.

IRRIGATION DISTRICT BONDS.

The recent session of the legislature enacted a law regulating the issue of bonds by irrigating districts, which, had it been part of the original Wright act, would have been worth millions of dollars to the state.

It would have been worth a great deal had it been passed when the Chronicle was urging it twelve or fifteen years ago, when there was a general onslaught on the districts which had sprung up under the Wright act and were generally on the way to bankruptcy. Had the law been enacted then, some of the districts which failed could have been reorganized and saved, and those whose condition was hopeless could have made some kind of a settlement and relieved their lands of the lien upon them.

But it is better late than never, and the passage of this law ought to make these bonds gilt-edged securities, for they will be as good as human foresight and ingenuity can make them.

In brief, the law requires that hereafter no irrigation district bonds shall be issued except upon the favorable report of a commission composed of the State Engineer, the Attorney-General and the State Superintendent of Banks.

The State Engineer will pass upon the adequacy of the engineering operations and water suply. The Attorney-General will pass upon the title to any land acquired, and especially the water. The Superintendent of Banks will pass on the value of the property subject to taxation for payment of the bonds and the general ability of the district to carry the burden regardless of the outcome of the irrigation project.

Bonds cannot be sold to prudent investors when payment is doubtful in case of failure of the irrigation project. Whoever buys such bonds assumes a speculative risk which pru-

dent investors insist that borrowers hall take.

That was the trouble with the old district bonds. They were all specula- ive—most of them highly speculative. Few of them could possibly be paid unless the lands of the district were promptly subdivided, sold, and put un- der intense cultivation. And that at that time was impossible. In many cases the water supply was inade- quate, or alkaline, or of uncertain title. Or the projected works and estimates were insufficient. In some cases there was actual fraud.

And so most of the irrigation dis- tricts went to smash, with the lien of the bonds still clouding the title to the lands, and the sale of irrigation bonds stopped for half a generation. None of these things could have hap- pened had the present law been in force. The majority of the districts probably would have lapsed without incurring any debt, for in the eighties the time was not ripe. But those that started would have succeeded.

Now irrigated lands, well situated, can be sold, settled and paid for, for there is a market for the products at prices which will pay the bills. And district irrigation bonds issued with the approval of the newly created commission will be gilt-edged. And the law very properly makes them available as investments for savings banks and trust funds.

One quality they will still lack, and that is prompt marketability under all conditions. Savings banks, and espe- cially estates in trust, often wish to sell securities. Marketability, there- fore, affects the price even of bonds the redemption of which, according to their terms, is undoubted.

There is but one way to assure this marketability, and that is to have the bonds listed on the New York Stock Exchange. Then, if the volume out- standing is sufficient to attract atten- tion so that investors become familiar with their character, current prices will become established and a ready market made for them. The coupons should also be made payable in New York at holder's option.

There are now many irrigation bonds in the market—some good, some doubtful, some bad. At present the market only recognizes "irrigation bonds" and is shy of them.

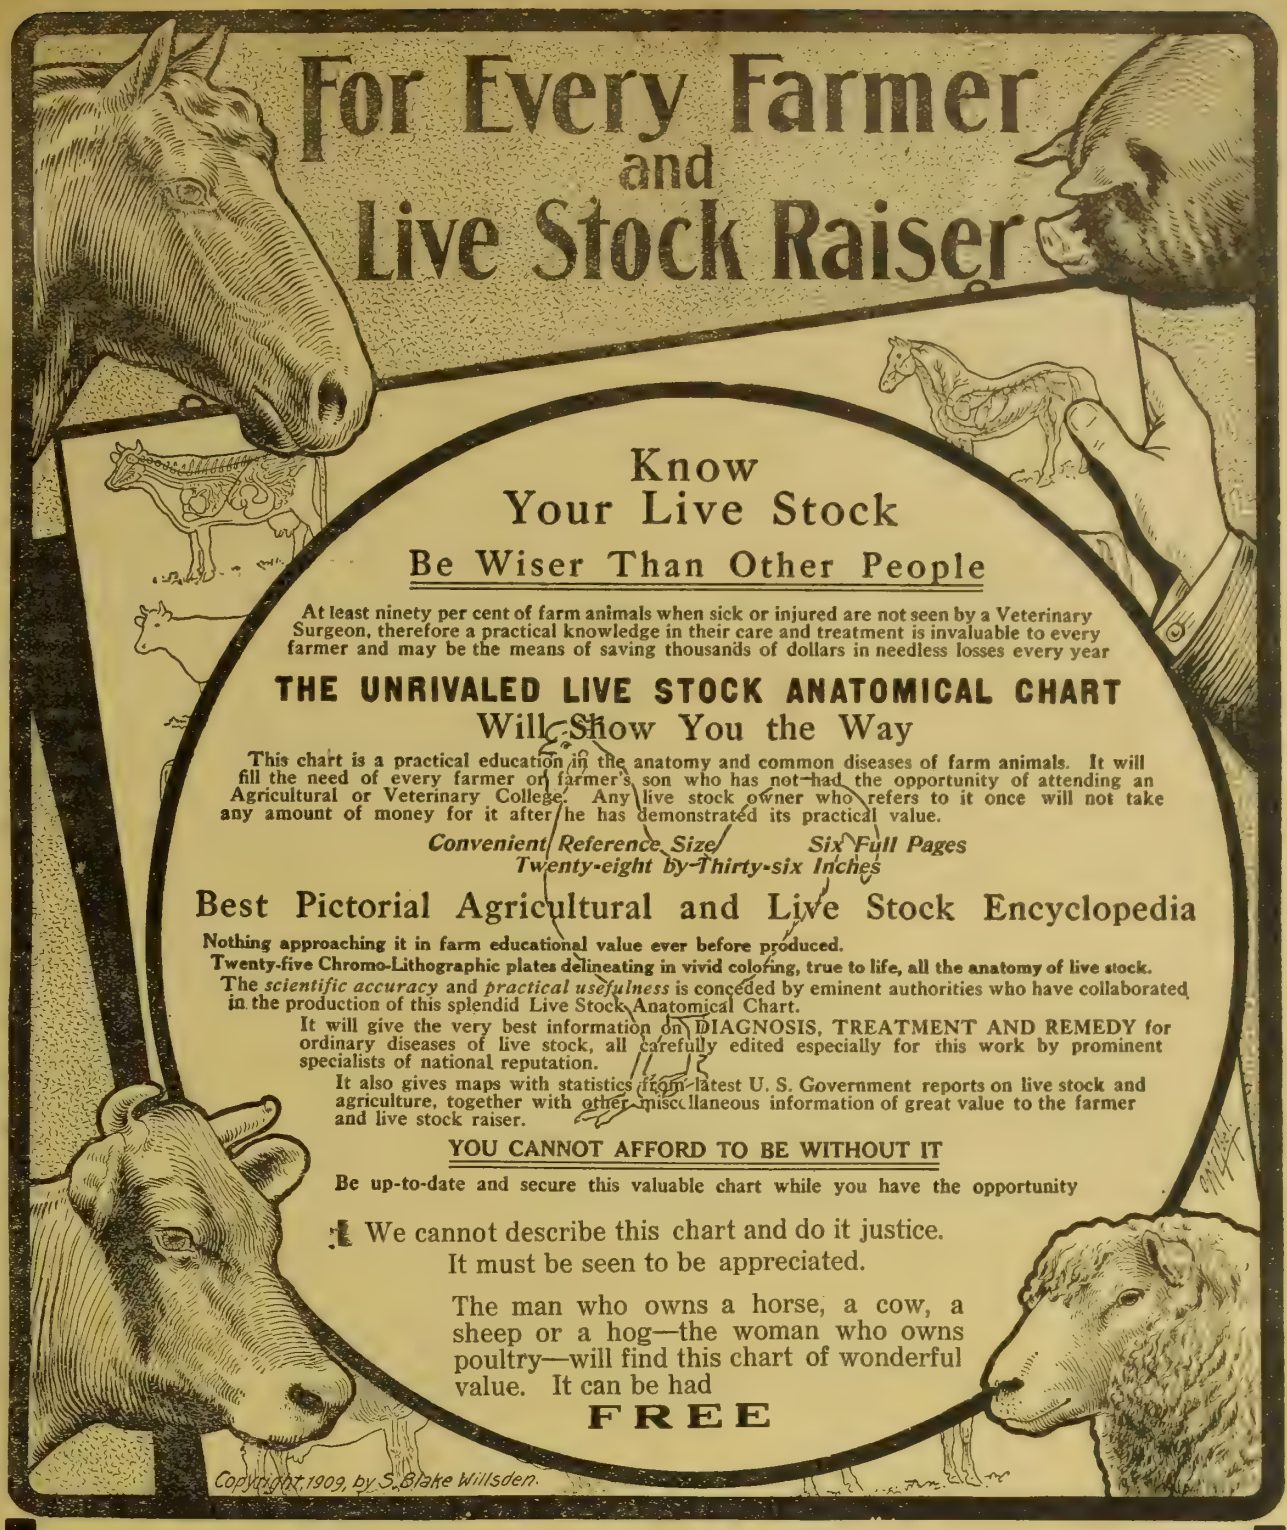
It is possible for our districts, by co-operation and a very moderate amount of advertising, to create a dis- tinctive New York market for "Cali- fornia district irrigation bonds." And if that is done, 5 per cent bonds should sell at a premium sufficient to more than pay all expenses. Of course, be- ing free of tax in this state, district bonds are worth more here than else- where, but buyers have ways of look- ing out for that. A good New York market would add greatly to the value of these bonds wherever sold.—San Francisco Chronicle.

TWO SYSTEMS OF JURISPRU- DENCE.

Hubert Bruce Fuller in the World's Work for June:

The comparison between the Eng- lish and American systems of juris- prudence and prevalence of crime are interesting and striking. The two peoples are of the same race—the sys- tems of government are almost identi- cal in principle, and the laws of both have for their origin the common law of England. In the United States the number of homicides is 115 per mil- lion inhabitants, while across the line in Canada it is but three. Why should human life be held so dear in Canada and so cheap in the United States?

For Every Farmer and Live Stock Raiser



Know Your Live Stock

Be Wiser Than Other People

At least ninety per cent of farm animals when sick or injured are not seen by a Veterinary Surgeon, therefore a practical knowledge in their care and treatment is invaluable to every farmer and may be the means of saving thousands of dollars in needless losses every year

THE UNRIVALED LIVE STOCK ANATOMICAL CHART

Will Show You the Way

This chart is a practical education in the anatomy and common diseases of farm animals. It will fill the need of every farmer or farmer's son who has not had the opportunity of attending an Agricultural or Veterinary College. Any live stock owner who refers to it once will not take any amount of money for it after he has demonstrated its practical value.

Convenient Reference Size *Six Full Pages*
Twenty-eight by Thirty-six Inches

Best Pictorial Agricultural and Live Stock Encyclopedia

Nothing approaching it in farm educational value ever before produced.

Twenty-five Chromo-Lithographic plates delineating in vivid coloring, true to life, all the anatomy of live stock.

The *scientific accuracy* and *practical usefulness* is conceded by eminent authorities who have collaborated in the production of this splendid Live Stock Anatomical Chart.

It will give the very best information on DIAGNOSIS, TREATMENT AND REMEDY for ordinary diseases of live stock, all carefully edited especially for this work by prominent specialists of national reputation.

It also gives maps with statistics from latest U. S. Government reports on live stock and agriculture, together with other miscellaneous information of great value to the farmer and live stock raiser.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Stick Tight Fleas.

Please give remedy for stick-tight fleas. They are infesting horses, calves, chickens, cats and dogs, and even people.—Subscriber, Kerman.

This is an exasperating pest and will cause the loss of chickens by the wholesale. Probably the simplest and cheapest remedy is spraying everything with a strong brine. Some have gone so far as to use several hundred pounds of salt and spraying over the entire yards, turning on the hose occasionally to keep it moist. Those who follow this plan report it completely ridded the place of these fleas. A solution of corrosive sublimate, salt and water, applied with brush to the pests which are now on the animals will eradicate them. In doing this, whether on poultry or on the larger animals, care must be used not to get it into the eyes. Of course it is understood that corrosive sublimate is a deadly poison.

Rheumatism Affecting Milk.

Is it safe to use the milk from a cow that has rheumatism? At least we think that is the trouble, as she walks very lame in hind quarters.—Subscriber, Kerman.

We do not think this trouble would have any effect whatever upon the milk.

Fumigating Beans.

If J. A. C. of Anaheim will send name we will mail copy of the paper which will answer the weevil and other questions.

Drying Figs.

What is the proper way of drying the white fig? Also how preserve them?—Subscriber, Brawley.

Allow to ripen perfectly on the trees and handle carefully. Some dry just as they come from the tree, others expose to the fumes of burning sulphur. The object of fumigating is to give lighter color, prevent fermentation and kill any forms of insect life which may be present. If the sulphuring is done, let it be as soon as the figs are picked from the trees. Some prefer dipping in boiling water instead of sulphuring. It surely gives a higher quality of fruit. If salt is added at the rate of a pound and a half to every fifty gallons it is still better. They are then dried on trays, using care not to dry too hard. That they may dry evenly, turn once or twice daily. When turning if any are found souring they should be thrown away or used in the manufacture of vinegar. In case of rain or dew, see that they are covered. When dried place in sweat boxes to equalize the moisture. Another dip in boiling salt water proves beneficial if they are to be kept any length of time, and also softens them to aid in packing into bricks.

For preserving proceed as follows: Gather the figs with the stems on just before they are ripe enough to be eaten. Scrape off the skin carefully and drop the figs into a kettle of clear, boiling water, and leave half an hour. Then take out and allow to cool with the stems up. Make a syrup of a pound and a half of sugar and a half pint of water to each pound of fruit. Boil the syrup till nearly roping; put in the figs carefully and keep them under the water while cooking. If other than the natural flavor is desired, put a clove in the blossom end of each fig or cook them with a sliced lemon from which the seeds have been removed, adding a little ginger. The preserves keep well if made with an equal weight of sugar and figs.

To Color Cheese.

You have taught me how to make cheese. Now I would like to know what kind of coloring to get and how to use it. I tried the dandelion and it won't color the curd.—T. M., Gridley.

While there may be other makes as good I have always used the Hansen products in coloring and in rennet tablets. Glad you are having success with cheese making. There is always a good market for the small cream cheeses of an eighth of a pound weight.—M. E. S.

To Separate Butter.

Have a cow that freshened a few weeks ago. The first two or three times churning of butter was fine, but since that the butter and buttermilk will not separate and after churning becomes thick like cake batter. Cow is fed dry alfalfa hay and green barley. Can you please tell me the cause and how to remedy it.—Subscriber, Anaheim.

The temperature at which the milk is held is probably the cause of this trouble. When the milk is first set, put a pint of hot water into each gallon of the milk, enough hot water to bring the milk back to blood heat again or 98 degrees. Then put the pans into as cold a place as possible, so the cream will rise quickly. Stir the cream in the cream jar every time new cream is added. When the cream is smooth and sharply acid it will churn clean. If it is not like this, then it is not ripe for the churn. It can be ripened by stirring the cream with clean bottles filled with hot water until the cream reaches a temperature of 80 degrees. Cover it closely and let it stand for an hour, remove the covering and let it chill down to 45 and churn it in the morning, at that temperature or as near it as 50 degrees. If properly ripened it should churn in twenty minutes, the butter coming in granules the size of wheat. Stop the churn and cover the butter, after running off the buttermilk, with cold salt water. Let it remain under water while scalding and chilling the butter bowl. Rock the churn a few times to gather the butter, run the water off and cover again with water, rocking the churn to finish gathering it together. Run off the water, gather the butter into the bowl. If the butter is firm work at once; if soft, stand the bowl in a cool place a couple of hours before working.—M. E. S.

Early Onions.

How do they plant onions around Stockton and Lodi so they can have them ready for market in the spring? Is Greiner's new onion culture practical in California? I have his book. Where can I get such information if you cannot give it to me?—A. B., Raymond.

The earliest onions are produced from sets that are planted in August, September and October, and chiefly of the White Bermuda (which is really a straw color), Crystal Wax or White Portugal.

Greiner's New Onion Culture is in the main all right for California conditions, especially as it relates to the method of raising the plants in seed bed and transplanting to open ground instead of sowing the seed in rows and thinning. The latter method will invariably produce a large proportion of "thick necks" and it is more expensive to thin, than to transplant.

If the inquirer is a newcomer and wishes to engage in the work of growing onions for market, it would be money and time well spent to visit the localities he names and learn from the men who are doing the work there the things he needs to know. It will save him many costly errors.—Q. A. L.

Roup, Canker, Chickenpox.

Some of my chickens were affected with roup, canker and chickenpox. I dipped their heads in a solution of one pint of warm water and a teaspoonful of permanganate of potash holding under while I counted ten, and it cured all of them in a few days, except one that was too weak to stand when I tackled him. I have tried other treatments but none were as effective or easy as the dip. One can use it several times if kept covered.—Subscriber.

Legal

Edw. L. Payne, attorney, 301-302 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Exemption.

What property is exempt from seizure in the state of California? I married man gives chattel mortgage on property exempt from seizure without the signature of his wife, can his wife hold the property?—Subscriber, Reedley.

The enumeration of property exempt from execution in this state would take too much space, and I apprehend the better way would be for you to designate in a question the particular articles in which you are interested. If the property mortgaged was the separate property of the mortgagor, or the community property of yourself and wife, it would make no difference that she did not join in the mortgage. The fact that the property mortgaged is exempt from execution makes no difference.—E. L. P.

Stepdaughters not Heirs.

I married a widow with two daughters and have two sons of my own. To whom will my property pass after death of my wife and myself, that is would my wife's daughters have an equal share with my sons?—Subscriber, Otay.

Unless you adopted your wife's daughters, they would have no legal claim upon your estate.—E. L. P.

It is possible Mr. Payne did not consider the contingency of the husband dying before the wife. In this

FAIRBANKS-MORSE

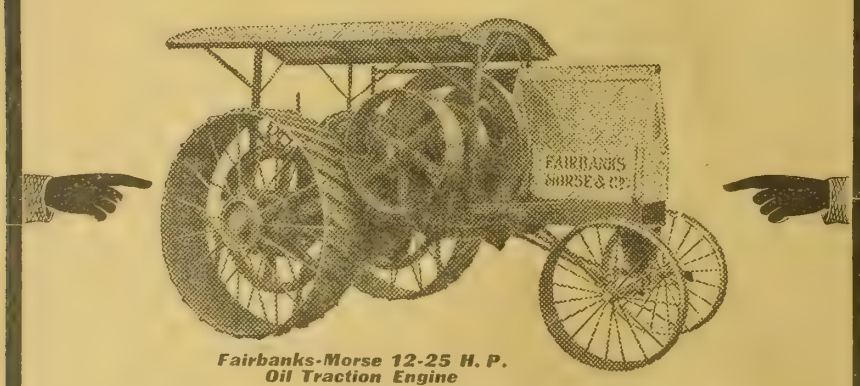
This Name Is Your Guarantee

Our 30-60 Horse Power Oil Traction Engine will be ready for delivery October 1.

Write For Catalogue LA 37

Our 2-cylinder, 4-cycle Engine will operate on 3-cent distillate, as good as with the best gasoline.

It Gives Full Details About This Traction Engine



Fairbanks-Morse 12-25 H. P. Oil Traction Engine

The Simplest, Most Durable and Easily Handled Traction Engine on the Market

The drawbar pull of this engine is equal to 12 horses. When used as a belted engine, 25 H. P. can be developed. It is well adapted to Threshing and Hay Baling.

We Are Absolute Headquarters for

Gasoline Engines ***Hand and Power Sprayers***
Hand, Windmill and Cistern Pumps
Irrigation Machinery of Every Nature

FAIRBANKS-MORSE & CO.

425 East Third Street, Los Angeles, Cal.

case, we believe, the wife would inherit one-third of the estate, and this portion at her death would pass to her children.—Ed.

Right of Way.

A agreed to sell to B (a railroad company) a strip of land for a right of way; B agreed to adopt this route if the people of this community would furnish the right of way. After a committee had secured pledges for enough to buy the right of way, A gives B a deed and puts it in the hands of the secretary and treasurer of this committee to be delivered to B when the amount agreed upon had been paid to A. In the mean time A has permitted B to do the grading across his place. Now some of the people who pledged to help buy the right of way have refused to pay. Can A stop B from laying the rails or any other work on his place without an injunction until A has received the money and the deed has been turned over to B?—J. T. H., Laton.

A, having permitted B to go into possession of the right of way, cannot eject B by force, but must appeal to the courts for his remedy, if B refuses to vacate. Neither can A by force compel B to cease work on the right of way.—E. L. P.

Community Property.

A deeds a triangular piece of land, dimensions 100 feet, to B. A's wife does not join in the deed. Consideration is $1.00. Is B's title good? Has A a legal right to give a warranty deed to his orchard covering this lot? B agreed to occupy land and pay taxes, which he has not done.—Subscriber, San Diego.

If the land deeded was the separate property of A, or community property of A and his wife, the signature of the wife is not necessary to conveyance of the title. Ordinarily, a verbal agreement is not permitted to vary the terms of a written document, and I presume would not be permitted to annul this deed. If the agreement to occupy and pay taxes on the lot was the consideration for the deed outside of the nominal sum of one dollar, and the deed would not have been made except for the verbal agreement, it is possible that under steps properly taken the conveyance could be rescinded. If the conveyance is a good and subsisting one, A has no right to convey the lot to any one else.—E. L.,

THE WONDERFUL LITTLE COUNTRY.

Mr. Booker T. Washington, in the World's Work for June, gives a number of observations he made during a recent visit to Denmark:

"I have heard it said repeatedly since I was in Denmark that the Danish people as a whole were better educated and better informed than any other people in Europe. Statistics seem to bear out this statement; for, according to the immigration figures for 1900, although 24.2 per cent of all persons over fourteen years of age coming into the United States as immigrants could neither read nor write, only eight-tenths of one per cent of the immigrants from Scandinavia were illiterate. Of the Germans, among whom I had always supposed education was more widely diffused than elsewhere in Europe, 5.8 per cent were illiterate."

Mr. Washington says also that Denmark is the most progressively agricultural and the most democratic place in the world, and that it has more telephones to the number of inhabitants than any country in Europe.

The restoration of navigation of the Mokelumne River will aid in the development of 200,000 acres of rich land.

LIVE STOCK

STALLION FOR SALE.
The Imported Percheron Stallion
SANSONNET.
Color gray. Foaled March 1, 1905.

SANSONNET was considered by Mr. Charles Aveline, President of the Percheron Society in France, to be the best two-year-old that he ever raised. With immense size, heavy bone, short legs and enormous width, Sansonnet possesses in the highest degree all the qualities most sought for in a perfect draft horse. It is not often that such an extraordinary individual is permitted to leave his native country, and the breeders of America are very fortunate in securing the services of a horse that any breeder in France would be proud to place at the head of his stud of pure-bred mares.

SANSONNET was entered in the Colt class and open class at the International Live Stock Show, Kansas City, Mo., in 1906, and took the blue ribbon in both classes. Weight 2,000 pounds. Sure foal getter and splendid disposition.

Terms to responsible parties. Apply to Wm. M. Way, Secretary Farmers Percheron Horse Association, R. F. D. No. 5, Modesto, Cal.

Stallions for Sale—Acclimated animals. All harness broken, sound and gentle. Leader 40637. Dapple gray, 8 yrs. old. Ladoga Leon, 66619, 2 years old. Dark gray. Dam weighs a ton. Liberty 74310. Black yearling. These three are registered in the Percheron Society of America. Atwood, bay carriage stallion, 2 yrs. old. Solid color. Sired by Athadon, 1st dam by Junio, son of Electioneer. McKinney Don, 2 yrs. old. Solid bay with black points. Sire Stanford McKinney. 1st dam Belladonna, standard by trotting record. 2nd dam by Athaneer. Both well broken to buggy. Minnewawa Stock Farm, Fresno, Cal.

For Sale—Imported coach stallion, Registered No. 4113. In his prime, sound, kind and stylish. Guaranteed. Colts of the finest type to show. Dr. Fred G. Matthews, 1232 Central Ave., Los Angeles. Both phones.

Grapewild Farm Herd of thoroughbred Berkshires. State fair prize winners. Boars and sows of all ages, unrelated. Address A. B. Humphrey, Mayhews, Sacramento Co., Cal.

Dairy Floating Thermometers and all kinds of supplies for the dairy at Guy F. Kelsey Co., 108 E. 8th St., Los Angeles. Phone Sunset Main 7496.

For Sale—Shorthorn bulls and Berkshire hogs. Bred for size and quality. H. L. Murphy, Perkins, Cal.

Three Holstein Friesian Bulls, splendid young animals for sale, well marked and subject to registry. Write at once to Geo. G. Roeding, Fresno, Cal.

WANTED

Local Representative Wanted. Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. The National Co-Operative Real Estate Company, L 448, Marden Bldg., Washington, D. C.

Manager of Orange Property—Have had wide experience in handling orchards and alfalfa. Wish position as manager or in directing labor. Specially wide experience with the citrus. Address Y, Cultivator Office.

DAIRY SUPPLIES

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

GUY F. KELSEY CO.
Full line of dairy supplies. Come in, phone or write. Generous sample of Prosperity Washing Powder given on request. 106 East Eighth St., Los Angeles, Cal. Phone Main 7496.

Makes Money for You—New sugar-beet pulp (Kow Breakfast Food) takes the place of green grass, and is conceded to be the best butter producer in the world. Price 50c per ton f. o. b. cars or wagon at Los Alamitos Sugar Factory, Los Alamitos, Cal.

Household Department

BE LOVELY WITHIN.

Little Evelyn's cheeks bloomed in delicate pink,
And her clustering hair framed with tendril and curl
A face so lovely you never would think
She could be for a moment a cross little girl.

Yet cross she was, in a constant fret,
Every hour she spoiled with some trouble or strife,
Till every one said: "Well, I never have met
Such an ill-natured child in the whole of my life!"

Her sister Peggy was plain and small,
Freckled and homely, with straight brown hair;
But you never thought of her looks at all,
For she seemed to be everything sunny and fair.

"I can't-" and "I won't-" that was Evelyn's cry
From morning till night, against all she was told;
While Peggy's low voice would be saying, "I'll try,"
With a patience and hope that were good to behold.

Till at last Peggy's freckles more beautiful grew
In every one's sight than all Evelyn's charms
Of pink cheeks, golden hair and eyes violet blue;
No one wished to fold her in affectionate arms!

But Peggy! Love found her wherever she went,
Clasped her warm little hand and looked into her eyes,
Smiled on her and blessed her with joy and content,
For her spirit within was so sweet and so wise.

Never mind, children dear, about plainness of face,
But strive all you can to be lovely within,
And the beautiful spirit will clothe you with grace,
And this is a joy every mortal can win.

—Celia Thaxter.

THE LIFE PRISONER.

The murderer was sitting in a dark cell in the deepest cellar of the great prison. Three times he had attacked the wardens. For the two first offenses he had been whipped, after the third he was placed in chains and from that day he grew more sullen and desperate than ever.

Then the old director of the prison died and a new man came to take his place. The news of this spread among the prisoners and hope and fear took possession of their minds.

One day footsteps were heard outside the murderer's cell, the door was opened, the warden remained outside while another man entered. He was blinded by the darkness and at first he saw nothing, but the murderer saw him plainly enough. He stood up and glared at the intruder, a young pale man with almost transparent features. His eyes were blue and dreamy, his hair blonde, as was also his curly beard.

"The director," the rough voice of the warden outside announced. The murderer straightened himself a little more and the director stepped closer. His eyes had now adjusted themselves to the darkness and it was easily seen that the surroundings made an unpleasant impression upon him, but his voice was calm and gentle.

"You are convict number seven?"

"Yes, sir."

"You have been whipped twice for a very serious offense."

"Yes," the prisoner replied sullenly.

"You have been put in chains?"

The prisoner did not reply, but rattled his chains defiantly.

"I am the new director. You must not consider me your enemy, but rather your teacher."

"Teacher!" the prisoner repeated, with a scornful laugh.

"Yes, teacher."

An impatient movement was heard outside.

"I want to treat you with kindness if possible. I consider that treatment more useful than whippings."

"Yes, sir," replied the prisoner, mechanically, without understanding the director's words.

"Today is the first of October. I shall return on New Year's day. If you have behaved well during the three months, I will give you something no prisoner has ever had before. Now try to improve."

The director placed his small white hand on the convict's shoulder and the unfamiliar touch of a kind hand made the prisoner's knees tremble.

The director left, the door was locked, the sound of his steps died away in the hall.

The prisoner's first thought was a touch of emotion, the second of hatred, because here was a man he felt would prove stronger than himself, the third and last was the question: "What did the director mean when he said he would give me something no prisoner ever had before "

He tried to find an answer to this question for days, weeks and months. He thought of all the things not to be found in a prison. A looking glass? He had not seen his own image for years, but prison life had made him lose every trace of vanity.

A flower? There had been a time when his highest wish had been to get a flower in a pot that he might take care of it and watch it growing—but now he cared no longer for such a thing.

At last he thought that there was nothing in particular that he was longing for and he was from now on only curious to see what the director might give him.

With his fingernail he scratched a mark on his bench for every day that passed and one day he discovered that it was New Year's Day. He had been as quiet as possible since the first of October and his mind had been entirely occupied with speculations as to what he was to get.

He trembled at the thought that there might be something to be said against him, that he should never know what the director had planned to give him.

At noon he heard steps on the stairs, and steps were as words to him, so acute had his sense of hearing become. He plainly recognized the steps of the warden and the director, but there was another sound he did not understand, a kind of light tripping which filled his heart with strange forebodings. Long before the steps reached his door he was already standing at attention. The blood was hammering at his temples and his heart beat violently. Would they pass his door? His excitement was almost more than he could bear.

No, they stopped outside. The door

slowly opened screechingly on its hinges and the director entered.

"Have you behaved well during the three months since I was here last?" he asked.

"Yes," he answered in a voice that trembled a little.

"You remember I promised you a reward?"

He had barely strength to answer. If he remembered?- He who had thought of nothing else for three months.

"Now you are to have it."

The murderer trembled all over. The director whistled and a small black poodle came in, slowly, cautiously, as if it feared a trap.

"That is for you," the director said.

The murderer looked at the director, and there was a gleam of suspicion in his eyes as he asked, "How long am I to keep it?"

"As long as you treat it well and behave well."

The director saw the light of a great joy in the convict's eyes, but he said nothing.

The door was barred again and the prisoner was alone with his new comrade.

For a long time they stared at each other. He was afraid to call the dog, because he had a feeling it would not obey him, but at last he tried. The poodle came slowly and at last stood quite close to him. He got courage to pat its head. It placed its front paws on his knees. He nearly tumbled over from the shock, but he recovered and patted the dog with both hands. The dog jumped on his lap and licked his forehead and eyes until the murderer burst out crying.

From that day there were no more complaints about convict number 7, though he sat in the cell for six years longer.

When he died the dog was set free, but it cared for nobody. It laid down on the murderer's grave and refused to eat and drink. It died rather than live without the only friend it had known since it was a small puppy.—Journal of Agriculture.

CAKES WITHOUT EGGS.

White Cake.

One cup sugar, good quarter cup butetr, cream together, add one cup sweet milk, one teaspoon flavoring, two cups flour, one teaspoon baking powder sifted through the flour three times. This rule will make a nice cream pie. Bake the mixture in Washington pie plates. When cold, lay between and on top whipped cream.

Fruit Cake.

One-half cup white sugar, scant half cup butter, half cup molasses, one teaspoon soda stirred in molasses to foam, half teaspoon each of clove, nutmeg and cinnamon, one cup stoned chopped raisins, half cup currants, half cup citron (flour the fruit), two and one-half cups flour, one cup sour milk. Bake slowly.

Ribbon Cake.

Bake the white and fruit cake mixture in long tins. When done, lay together with jelly, and you will have a nice ribbon cake almost equal to the one made with eggs.

SCALLOPED TOMATOES.

Pour boiling water over enough ripe tomatoes to make a quart when "dressed." Remove the skins and slice enough for a layer an inch thick in an enameled ware basin that has been well buttered. Over this put a layer of bread crumbs half an inch thick, and sprinkle a bit of salt over them. Drop on a few bits of butter the size of peas. Put in another layer of tomatoes, and over that one of bread crumbs, finishing as before, with salt and butter. Continue alternating the layers until the dish is nearly full—the upper layer being of bread crumbs, and these much coarser than those that went into the interior of the scallop. Bake half an hour in a hot oven.

TOMATO SOUP.

Peel two quarts of tomatoes, boil them in a saucepan with an onion and other soup vegetables; strain and add a level tablespoonful of flour dissolved in a third of a cup of melted butter; add pepper and salt. Serve hot over little squares of bread fried brown and crisp in butter. An excellent addition to a cold meat lunch.

ORANGE PUDDING.

Peel and separate into quarters three large oranges; put in a bowl and sprinkle with sugar. Make a boiled custard with a pint of milk, the beaten yolks of three eggs, three tablespoonfuls of sugar and five drops of vanilla flavoring. Beat the whites of the eggs until stiff, add five tablespoonfuls of sugar, drop in teaspoonfuls on a buttered baking tin and set in the oven until delicately browned. When ready to serve, pour the custard over the oranges and arrange the little balls of the whites of the eggs on the top.

DRESS.

Courage oozes out of the holes in a ragged suit, and fear enters. But give the same man a new suit, clean linen, a good hat and shining shoes, and you will see how soon fear will fly away and confidence be restored. He who before was afraid to speak in whispers, lest he might be heard and consequently seen, will now talk loudly of million dollar propositions, though he may not have a cent in his pocket. It is the duty of every man to dress as well and neatly as his means and circumstances will allow. He should cultivate taste in his apparel and show wisdom in its selection. His main object should be to give grace to his figure and attractiveness to his general appearance; but, above all, he should dress in accordance and in keeping with his station in life.—Rev. Madison C. Peters.

PRESERVING SIGHT.

"In every text-book in one large city is to be pasted a label containing the following:

"Your eyes are worth more to you than any book.

"Your safety and your success in life depend on your eyes; therefore, take care of them.

"Always hold your head up when you read.

"Hold your book fourteen inches from your face.

"Be sure that the light is clear and good.

"Never read in a bad light.

"Never read with the sun shining directly on the book.

"Never face the light in reading.

"Let the light come from behind or over your left shoulder.

"Avoid books or papers printed indistinctly or in small type.

"Rest your eyes by looking from the book every few moments.

"Cleanse your eyes every night and morning with pure water."

It has been well said that a farm can never rise above the level of its owner.

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A lobe tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Hay.

Scott, Magner & Miller say:

Receipts have sharply increased during the past week, the amount which we have received totaling 3700 tons. Arrivals by railroad were larger than heretofore, and during the last six days quite a fleet of boats have arrived. Quite a little coming by boat has been alfalfa hay. There is a firmer feeling generally covering the entire situation.

In several of the large districts there has been somewhat of buying going on this week, and quite a few lots have changed hands both for storage purposes and for current trade demands. There has been verry little hay sent out of the harbor recently on export or on coastwise shipments, and it is not expected that there will be any particular activity in this line of trade in the early future.

There has been somewhat of alfalfa moving into market, although the demand for this article at present is rather moderate. No large buying has been done, the operations being mainly confined to small purchases for immediate requirements.

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, July 22, 1911.

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, July 21, 1911:

Cherries—One car. There have been no cherries shipped since the 19th, when one-half a car was forwarded. The movement is now finished.

Apricots—10½ cars. Although over ten cars of this fruit is reported, this is an error, as nine cars destined to local canneries were erroneously included by the railways in their report. The actual movement of this fruit from the state should, therefore, be reported as one and a half cars. This concludes the shipment for the season.

Peaches—71½ cars. As indicated in our letter of last week, the quantity of peaches going forward has been rather limited, being about twelve cars less than for the preceding seven days. Fruit has not been ripening as rapidly as expected, but during the next week we expect to see a considerable increase in the output. Early Crawfords and Fosters will be the principal varieties. The crop is generally light. Elbertas cannot be expected in quantity much before the first of August.

Plums—157 cars. As expected, the shipment of this variety has dropped off, and it probably will continue to do so during the remainder of the season, although there are very considerable quantities left and shipment will be maintained in fair volume for some time. Tragedies are nearly done. Most of the Santa Rosas have been shipped. Diamonds are still very scarce, but will be more plentiful at the end of the week. Some Yellow Eggs will be available about the same time.

Pears—155¾ cars. The output of Bartletts from the river is disappointingly small. This should have been one of the heaviest weeks, whereas it is comparatively light. It is not expected that there will be many more shipped next week than this. Thrips is reported at work in some sections, and may have the effect of further reducing the small quantity offering. The demand is very strong and it has been impossible to supply all that have been asked for.

Grapes—18 cars. Thompson Seedless and Malaga are being shipped from the Imperial district. These varieties will not appear in quantity in the central portion of the state for several days yet. There should be a considerably increased movement from the southern districts during the coming week. Fontainbleaus are going forward from the northern districts in increasing quantities, but there will not be enough of them to cut much figure.

Weather during the past week has been favorable, generally speaking. The last two or three days have been considerably cooler than those preceding them and this has had the effect of making a considerable increase in the mildew which has been heretofore noted as appearing in several sections. Otherwise the grape crop is looking fine.

Citrus Fruit Market

LOS ANGELES, July 26, 1911.

The astonishing results being secured in the marketing of the immense crop of citrus fruits this year are attracting attention to the value of co-operation in the marketing of our products. The production of oranges in such an immense quantity was the cause of early predic-

Cream Separators, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

tions of disastrous prices, but at no season of the year have there been prices which were disastrous or even the least bit discouraging. There are many factors which enter into the firm condition of the markets, but we believe greater than any other one is the powerful balance wheel in the California Fruit Growers' Exchange.

Valencias are going forward very liberally and present indications are that the market will hold firm until the close of the season. Fancys are commanding $3.00 to $3.25 f. o. b. California.

Lemons are not commanding the extreme prices of two weeks ago. In fact, there has been a material decline. This is principally because of the change in weather conditions and to a slight extent to heavy receipts of foreigns.

Shipments.

Shipments of oranges to date since November 1st, 1910, 34,032 cars, lemons 5,705, total 39,737. To same date last season: Oranges 23,356 cars, lemons 3,875, total 27,231.

NEW YORK, July 24.—Fifteen cars Valencias, one car seedlings and one car grapefruit sold. Market higher on oranges. Cloudy and warm.

On the next *Studebaker* Wagon you pass on the road

Why aren't they split and cracked like the ordinary wagon?

Because the ordinary wagon hub is made from oak, a wood that splits and cracks very easily, while

Studebaker WAGON

hubs are made from *Eastern black birch*, a very springy, tough wood, chemically treated, with great weather resisting qualities.

Western birch is used by some manufacturers, but it is even poorer than oak. It is *brashy* and will not stand the strain.

Studebaker hubs cost more than any other hub on the market, but they are stronger and wear longer.

Another reason why you should buy a *Studebaker* from

Newell Mathews Co.
Established 1886
Los Angeles, Cal.

ACCEPT GENEROUSLY.

"They are very fine people in every way, except"—the charitable minded acquaintance hesitated—"except that they don't know how to accept a kindness. They know how to give freely, but not how to let others have the pleasure of giving to them."

This is a phase of selfishness rather common and often quite unrecognized. The reward of giving may be in the satisfaction of the one to whom the gift is made, but it is not in a material return of the gift.

"I used to like cutting my daffodils to give my next neighbor," said a cordial neighbor, "but I found she would order flowers from the greenhouse to send back to me, and I couldn't keep on."

To stay in debt to another for kindness is sometimes the very sweetest way of returning the favor. The enjoyment of the pleasure of giving thus stays the longer with the giver. Appreciative thanks, lasting remembrance, a sense of delicate loyalty due to the giver in many different ways, these are the just returns for a favor rendered. Better than all else is the favor passed on to another, with the added word if may be, "So-and-so was kind to me about this, and I want you to share it, too." It takes real humbleness and a truly generous heart to be thus a grateful recipient of a generous and often a humble gift.—Ex.

EXPLAINED.

The Cannibal King: See here, what was that dish you served up to me at lunch?

The Cook: Stewed cyclist, your majesty.

The Cannibal King: It tasted burnt.

The Cook: Well, he was scorching when we caught him, your majesty.—Sketch.

RATHER PERSONAL.

Blinks (after the dispute)—Well, you ain't two-faced, anyway.

Squints—Yer admit that then?

Blinks—Yes! if you'd got another you'd have left that one at home.

Do it well. Whatever you undertake, put your whole life into it, and accomplish it in the best manner it is possible for it to be done. The business world wants a man who is thorough, and that man very soon climbs to the top.

Customer: "See here! I thought you said these things would grow in any climate." Dealer: "They will. But if you want them to grow in this climate you've got to have a hothouse for them, of course."—Puck.

Father: "Well, Reggie, how do you think you would like this little fellow for a brother?" Reggie (inspecting the new infant somewhat doubtfully): "Have we got to keep him, papa, or is he only a sample?"—Tit-Bits.

An essential for success is hard work. No man ever gets to the top round of the ladder without striving for it. Read the stories of great men, and you will find that their lives were lives of hard work.

It will be noticed that lemons are often utilized in cooking oranges. It is because cooking somewhat detracts from the delicate flavor, the characteristic of the orange, while that of the lemon, far more decided, harmonizes and helps replace the evaporated flavor of the orange.

MOTORING IN NORTH AFRICA.

A timely paper of the August Century (the Midsummer Holiday Number) will be an account of "Motoring in Algeria and Tunis"—from Algiers to Constantine and Biskra—by Abigail H. Fitch, in which the writer tells of the network of wonderful highways France has built through North Africa, of the unexpected comfort of a tour there, "without further guidance than good road maps and occasional inquiries from French-speaking people, and of many other details of interest to travelers and motor enthusiasts.

AUCTION

35 Fine Dairy Cows, Horses, Hogs, 1 Bull
At my place, 1½ miles southwest of Gardena.

Take San Pedro cars at Third and Main or Hill St., via Gardena to McKinley Home. Walk quarter mile west.

Tuesday, August 1, at 10 o'clock a. m.

Thirty-five dairy cows, many now fresh and giving large quantities of milk, others coming in soon, nearly all large Holsteins and Jerseys and Durhams, all young and in the very finest condition. In fact this is one of the finest dairy herds in Southern California. Intending purchasers are requested to come and see these cows milked any day prior to sale.

One team of horses, 6 and 8 years old, weight 900 pounds each—good delivery team. One draft horse 10 years old, weight 1300 pounds—good work horse. One 3-year-old Holstein bull. Three brood sows, one with pigs at side. New portable stanchions with corrugated iron roof.

Terms: $100 and under cash; over $100, one-third cash, balance 6 months' time with bankable note and 8 per cent interest; 5 per cent discount for cash on time sums. Free lunch at noon.

Buyers looking for first-class dairy stock should not fail to attend this sale. Mr. Sorenson is retiring from the dairy business and has instructed us to dispose of this herd positively without limit or reserve.

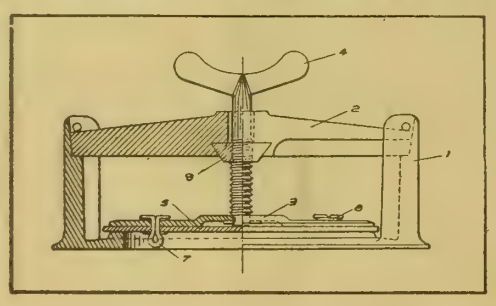
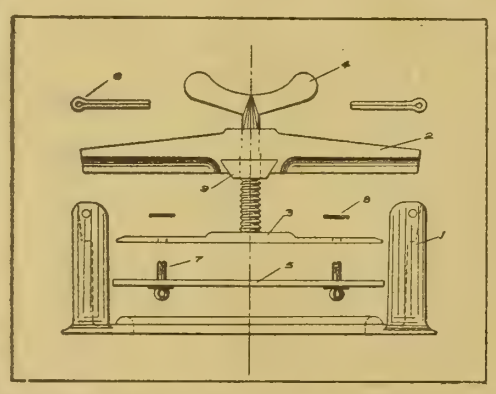
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

Kern Meadows Land and Water Company

Has 10,000 Acres of Farm Land to Rent

In tracts of any size, at $5 and $6 per acre or quarter share.

10-Inch Well Showing Artesian Flow.
(Exact reproduction of photograph)

Address
Herbert E. Carse, Cons. Engr.,
General Manager

WATER FREE

No tract in the West is better supplied with water. It all comes from artesian wells which flow 100 miner inches and more each. Some of these wells have been flowing 25 years.

THE LAND

is level and equal to the best for grain, hay, alfalfa, vegetables, general farm crops, cotton and rice. Is located 6-12 miles west of Santa Fe R. R. in Kern County, the nearest shipping points being Wasco and Elmo.

One acre produced 15 tons of onions, which brought $900.

MARKET

There is a good market for all hay and dairy products on the ground and in the Devil's Den, Lost Hill, McKittrick, Midway and Sunset Oil Fields, which lie west and southwest from Kern Meadows. Cream brings the highest market prices, collected at the dairy, and creamery company pays express charges from Wasco. Shippers facilties are complete for delivery by rail.

A Farmer Can Make Money on This Land.

Preference of employment on the company's improvement work will be given residents on the land.

Why and Wherefore in Soil Fertility

Address by Prof. C. B. Lipman, of the University of California, Before the Claremont Pomological Club at Pomona, July 15th

Most of us are dominated by inherited instincts and are ready to follow glibly in the footsteps of our ancestors. Nevertheless to progress we must know the whys and wherefores. We have been advised to plow deep, so far as the grain farmer is concerned, ten and twelve inches, if possible, for alfalfa 16 inches, but why are these recommendations made? A man naturally is averse to taking certain forms of advice without knowing the reasons why. This week I recommended to a certain orchardist a practice which might hurt his trees for this year, and naturally he was averse to trying it until I gave him my reasons for recommending it, until I showed him how I had worked it out and that he might expect much better results the next year if he applied it.

You cannot do anything which takes a high grade of intelligence without training in observation, a training in schools if you wish, in books, but a training of some kind, the more thorough it be, the better. Agricultural education is a good thing; extension work in agriculture is a good thing, but I consider of more importance a better general education of all the people whether they live in the country or in the city, with this idea in mind, that the properly trained mind, whether it obtains its training in one field or another of human knowledge is the one which will be able to reason out its own problems, to plan its own system of work, to grapple with the more difficult problems which take certain kind of training.

Mr. Jones of Pomona, Mr. Mills of Riverside, did not have agricultural training, yet they are making big successes; Mr. Neff at Anaheim had no special training for his work, but he got the training by personal observation, by careful and continued reading, which sharpened his wits and put his mind into a receptive condition which made it possible for him to work out his own plans, his own system of farming. He got hold of certain principles enunciated by scientific minds, which he could profitably put into operation in his place.

Application to Conditions.

There are certain troubles in our groves, some of such an extent that many have claimed the groves were decadent. The percentage of decadence has gone so far that some orchardists have taken strong measures to increase the efficiency of every tree and every acre. My answer to this opposition is that I don't believe any one man is going to solve your problems for you. I don't believe that one or two or a half dozen experiment stations can solve them for you. There are certain things we must know in agriculture as well as in other fields of endeavor. The problems which come to the grower should be settled largely by the grower himself. They will never be settled satisfactorily until every grower undertakes a little experiment station on every acre for himself.

The University and other experiment stations in other states, and the Department of Agriculture at Washington are glad to give the benefit of their experience, yet every grower should know the requirements of his own soil.

In irrigation, for example, a certain kind of soil allows water to spread laterally to a certain distance, but a plan worked out for this certain soil will not apply to others. You can't apply a system worked out for coarse soil to a clay loam. We cannot make a general rule, I don't care how many years you run a citrus experiment station at Riverside, for every grove in California. The station there is on clay soil and the experiments conducted there apply only to that particular type of soil.

Every man should have his own experiment station situated on a piece of his land. If you can't do the work yourself, get a good man to do it for you, but get one of your own number to work on your particular soil. Each one of you can give a little piece of land for trying out fertilizers, green manuring, or plans for irrigation. Of course, we must have an irrigation engineer to tell us that water will do certain work, how it runs from a certain watershed, where the water table is. What fertilizer company to buy from, which is more economical to use, fertilizer in mixed form or simple; these things the experiment station can work out, but the particular kind to apply, nitrate of soda or ammonium sulphate, you ought to find out for yourself, and can do it. You can do it more efficiently and with better results than any man in the center of a large district can do it for you.

Experiment stations should tell why certain operations are recommended. We should plow deeply because we have deep soils and our water percolates downward and the root systems are far deeper than in humid sections where rain falls the year around. Then by keeping dust mulch on the surface you allow the root system to spread without hindrance, for the larger amount of water you retain the larger amount of plant food is carried in the soil water.

Chlorosis.

In this state we have been searching out the causes of chlorosis. One man comes along and tells us it is due to excess of a certain chemical in the soil. We all have said a certain thing was responsible. One man said it was lack of lime, but didn't tell why. As to the lime-magnesia theory based on the writings of Dr. Loew, Dr. Loew demonstrated that as soon as the percentage of lime or magnesium rose to a considerable extent above a certain ratio, there was formed a compound with nitrogenous matter which produced a condition similar to disease. In other words, he found that too much of any mineral substance combined with organic substances was unhealthy for the plant, whether lime or whether magnesium combined to make the trouble. This was worked out in a scientific way in soils and it was found that where a certain proportion of lime and magnesium existed, they mutually counteracted each other's ability to combine with nitrogen and so kept the plant in a healthy condition. We have found this true of other elements. Sodium has just the same antagonism for potassium, strontium is antagonistic to other elements, iron and copper seem to antagonize each other. This was the principle upon which Loew based his recommendations. But we cannot afford to lose sight of the fact that experiments with soils in small wire baskets give no indication of what is going on in the field. These results are established by scientists the world over, such men as Hilgard, King, Wagner, Schultz.

Essential Plant Foods.

Nitrogen, phosphorus and potash are the great triumvirate, but we have not told why. Nitrogen we are losing by leaching from rains and irrigation. Of the phosphates all soils naturally contain more or less; in most there is naturally a short supply, yet phosphoric acid is an important constituent of every living cell. The potash supply in most of our California soils is rather high, but it is wearing out like all other plant foods. You cannot constantly take it out and say that the same amount is left. Chemists can tell you just how many pounds you take out in a box of oranges. The heavier we crop naturally the more potash we lose.

Turning Under Cover Crops.

We have been recommending in sandy soils deep turning under of the cover crop; in heavy soils shallow incorporation of the crop, but why? If we put cover crops under three or four inches in light sandy soil, we get dry oxidation, too much oxygen, and the green manure dries up and oxidizes away and we lose the humus which is what we are trying to get. If we put it under where it won't decay we lose what we are after. In clay if it is put under deeply, there is not enough oxygen, gases form and acid substances detrimental to any plant except sorrel or others of that kind.

Plowsole.

The breaking up of the plowsole is one of the most important practices in the groves of California. I have lately visited dozens of groves where the auger put down eight or ten inches would strike a hard substance which it would take muscle to drive through. Fertilizers do not go through it and water does not go through it. This hard stratum may form through plowing to the same depth time after time. In most cases in the orange groves considerable layers of silt form in the bottom of the irrigating ditches, the lime cements the clay and silt, forming a layer not so impervious as clay, but still impervious to water. In some light soils which are regularly plowed three inches deep, its formation is likely due to plowing; in the wheatlands this is doubtless the cause. You can get rid of it by putting in your irrigation furrows a little shallower, say an inch, then when you plow after the irrigation, get under the plowsole with your plow and you will have the same depth of tilth.

The Why of Humus.

Our humus supply is low in California. With the exception of nitrogen it is the controlling factor in soil fertility here. Humus is produced by the decay of organic matter. During our long season of drouth, seven or eight months, there is formation of an exceedingly fine mulch wherein oxygen circulates exceedingly freely and the organic matter is rapidly burned away, so that we are constantly losing our humus, even if we turn under a good cover crop every year. In spite of our cover crops our supply of humus is perhaps going down a little. Even if we don't add to it we have to maintain it.

Our humus is rich in nitrogen as compared with soils in the East. Nitrogen is inert and tends to remain behind after the carbon and hydrogen evaporate away, but actually the total amount of humus is low. Humus is the source upon which we have to depend for our supply of nitrogen. We can apply nitrate of soda, a little dried blood, a little tankage, a little ammonium sulphate, but the ultimate supply of nitrogen upon which the productivity of every acre depends is the organic matter in the soil, left over from the decay of barnyard manure, weeds and falling leaves.

Humus is the home in which is carried on the activities of a body of organisms which are just as important as we are. We do not see them. They are exceedingly small. We call them bacteria. They are so important that life on this globe depends absolutely on them because of the fact that they are the scavengers; they produce decay conditions by which humus is made possible and they make soluble the insoluble nitrogen in the humus.

Humus is important because of the fact that it cements our soil particles in the sandy soils and makes them hold water better. Anything we can do in light soils to help hold water is a distinct gain in soil productivity, and we can do it in a measure by put-

Citrus and Tropical Fruits

CO-OPERATION.

California citrus growers are so well organized there may be nothing to learn from the more recent efforts of Florida along the line of co-operation. But there are surely other producing lines in this state which should be aided by an inspiring address recently made by Mr. W. C. Temple, manager of the Florida Citrus Exchange and printed in the Florida Grower. Mr. Temple's address is so filled with information that we give it almost in full.

Mr. Temple says:

Webster defines co-operation as "operating together to one end—concurrent effort or labor."

All harmony is the result of co-operation, whether it be of human effort or of the laws of nature. The seasons and conditions must co-operate to produce your fruit. God made nature and her laws, and the co-operation of these laws makes the universe. Without co-operation there is lack of harmony, discord and failure in everything. The co-operation of mind, will and body makes man and the works of man. The co-operation of man makes communities, sections, nations. The individual man is a helpless unit, an atom in the sea of existence. The co-operation of a body of men in a community makes for strength, and that strength is just in proportion to the strength of the co-operation of the community for the good of the community. When any community is imbued with the single spirit that the injury or success of one is the concern of all, it becomes a community of great strength. The co-operation of many communities produces a nation, and the strength of the nation is in direct proportion to the co-operation of the individual units comprising that nation for the welfare of the nation.

Specialize.

Imagine the spectacle of one man claiming to be "independent" of all other men and mankind, and yet endeavoring to live in the world. Fancy this man producing for himself, and by his own efforts, his hats, shoes, clothing, food, medical care and the results of art, literature and science; and yet the mass of men by co-operation, each specializing in the direction in which he is best fitted, can produce as one harmonious whole the very highest exemplification of all of these.

So, if a man tries to produce, doctor, improve and perfect his fruit, he has plenty to do; specializing in many directions, each in itself sufficient for a life study.

If he as an individual attempts, in addition to proper production, to gather, grade and pack his fruit, he adds further specialized work which can be better done by those who have specialized in that direction exclusively.

Massing One Product.

Aside from the additional study and knowledge required to do it well, the matter of tonnage—or amount of output—also looms large and important; the greater the output the lower the cost per unit of output. This is the maxim of all the big successful businesses of the day—increase your tonnage and you increase your efficiency and decrease your cost. As an instance, a packing house of ample capacity to handle easily and smoothly 150,000 boxes of fruit in a season, can handle 25,000 boxes at a cost of 60 cents per box, while with 150,000 boxes annually the cost would be less than 40 cents a box—a saving of 20 cents a box, or more than enough to build the house, in one year; and, in addition to that, the work at the lower figure will be better done, and more uniformly, paradoxical as it may seem.

Suppose the transportation to market was attempted by individual effort. This would necessitate teaming from the grove to New York, or Chicago, or New Orleans, with the team in charge of the owner—unthinkable, isn't it? And yet that is what individualism means. From the co-operation of millions of individuals and thousands of classes of product the railroad is born and operated, increasing its efficiency with increasing tonnage.

Advertising.

After the specializations of grading, packing and transportation are properly attended to and the facilities for them are perfected, comes the most vital and highly specialized work of all—creating a demand, at a profit, for the product.

Do you question the statement, "creating a demand?" You have been accustomed, perhaps, to hearing the old familiar jargon about the "laws of supply and demand." This is a misnomer. There are no such laws. The terms are purely fictitious. You may create all the supply you wish and yet have no demand. Inversely, you may create a demand for almost anything thinkable, without a supply. The question arises, "How is a demand best created?"—by having a good article, that you know people should use, then letting them know you have it, then putting it in their hands in proper quantity, quality and condition—and at the proper time. Thus demand not only can be, but is created. Except for a few bare necessities of life, demand is never found ready-made for anything.

The father and originator of great advertising campaigns, William Morgan, who first invented, discovered, or fabricated—whichever you please—"Sapolio," in answer to a question from his partners to the effect, "Do you mean to tell us that you can mix sand with soap, and by advertising sell it as a new article?" answered, "I can by advertising sell mud for chocolate," and he could—once, but never more than once to the same customer. But if you have a good article your demand can be made continuous and increasing.

I am informed that Mr. Atwood has spent $25,000 in a single year for advertising his grapefruit, and I presume that he found that it paid, as he continues it. This is an indication of individual effort—there is probably no other grower in the State of Florida who could afford to spend this amount of money in one year's advertising, as this amount of money would cost Mr. Atwood nearly 50 cents a box on his crop; but the California Fruit Growers Exchange this year will expend approximately $120,000, or nearly five times the amount of Mr. Atwood's expenditure, in advertising the California product—and yet it only cost a cent a box. This is due to co-operation, "operating together to one end," and incidentally their operating together to that one end is rapidly

Sugar prune, pear and peach shipments began from Chico July 15.

bringing about another end, which, if not intended by them, is none-the-less serious to us; that is, the tendency to make the fruit consuming public of the United States forget that Florida is still producing oranges.

Overproduction.

We hear much about over-production of citrus fruits. Our advertising slogan is, and must be, "drink the juice," and coupled with that the advice to the consumer to "buy by the box." If we will co-operate and advertise to this end and we can create a demand for oranges by the box, and a thirst on the part of the general public for orange juice that might make it as popular a beverage (and it would certainly be a much more delicious and healthful one) as beer; and while you may not know it, if the average consumption, per capita, of orange juice per year by the citizens of the United States, was as great as their consumption, per capita, of beer was in the year 1910, it would require 300,000,000 boxes of juicy Florida oranges to furnish the juice, or something more than ten times the biggest crop in the history of the industry, from all citrus sections of the United States, California included.

This kind of a campaign can be conducted by co-operative effort, and in no other way. No grower, or local set of growers, in California could, without bankrupting themselves, carry on the advertising campaigns that California is carrying on, but by co-operation, they do it at a cost so slight that no one feels it.

If the Florida Citrus Exchange controlled two-thirds of the citrus crop of Florida, furnished to it ripe, it could distribute and market it perfectly at a cost of 6 cents a box, and spend $50,000 a year for an initial wedge in an advertising campaign. With the proportion of the crop we now handle it costs us 12 cents a box, without advertising—and at that, 12 cents a box is a far cheaper charge than that of any other agency operating in the Florida citrus deal.

Profits to Grower.

You hear a good deal of alleged 10 cents a box agencies, which, when the searchlight is applied, turn out to be nearer 30 cents a box than 10; and nobody could be deceived in this matter if the grower used the same intelligence in demanding a proper account of sale with his remittance as he shows in demanding an itemized bill when he buys his groceries.

Anything in a marketing line that can be done by an individual can be done by a co-operative body of individuals; and, inversely, anything in the marketing line that can be done by a co-operative society can also be done by an individual; provided, the individual has the time, ability and money to do it with; but there will be this difference in the end, which is the important difference for the grower, and that is, that when the individual undertakes, with a sufficient amount of capital and ability, to perform a service of this kind, he also undertakes to transfer to his bank account an amount of money in profit that is fully commensurate with the difficulty and risk of the operation, while in the co-operative society these profits go to you—the producer, and the one who co-operates.

(Concluded Next Week.)

The Kings County Fair Association is advertising its coming fair with a banner one by two inches in the form of a badge to be worn on Kings County coats. The date is September 25-30.

WARNING

Deciduous Fruit Culture

APPLE CROP INJURED.

A dispatch from Rochester, N. Y., in the Providence News, says:

"Despite the fact that the drouth in Western New York was effectually broken this week by heavy rains, prospects for apples have changed materially for the worse since blossoming time. The long, dry spell of June, followed by the withering heat of early July, did a great deal of damage. Apples have dropped heavily, it is asserted, and the present outlook is for a much smaller crop than the heavy bloom indicated. Baldwins promise to be short. In some orchards which last year had a full yield there is nothing now in the way of fruit. In other Baldwin orchards, where the crop was light last fall, there is a fair show of fruit. It is not believed Baldwins will be more than half a normal crop, while some say it will not be as large as that. That Greenings, Kings and Twenty-Ounce will be fairly good crops is the general opinion. Spys also give satisfactory promise in most localites. All these varieties have dropped quite extensively the past few weeks, but the trees were quite heavily laden, and the apples on the trees will be better for the loss.

"A News representative interviewed a number of up-state orchardists the past week. Park A. Davis, one of Orleans County's best known fruit growers, stated that after investigating conditions around Medina he came to the conclusion that apples are uneven and do not promise a good crop. This applies particularly to Baldwins. 'In my opinion there will not be more than 10 per cent of a crop of Baldwins in this section,' Mr. Davis stated. 'I would estimate the apple crop here at not over 25 or 30 per cent. Some of the orchards show a crop, but in the main only individual trees on Fruit avenue have had what might be called a good showing. Greenings promise much better than Baldwins. Twenty-Ounce, Spy and other fall varieties ought to be a fairly good crop.' Fruit avenue, which Mr. Davis alludes to in his interview, is unquestionably the biggest fruit street in Western New York. It has more than two miles of solid orchards on both sides of the road, with but three small breaks the entire length. It is at Medina."

THINNING APPLES.

There are several reasons for thinning, the following being the principal ones: First, maintaining the vigor of the trees; second, securing annual crops instead of alternate; third, to be able to produce fruit of maximum size, color and quality.

For thinning purposes, apples may be divided into two classes, viz.:

Those such as the Winesap and Missouri Pippin, which when the tree is loaded do not attain sufficient size for the better grade of pack; and those like the Ben Davis type, which generally attain sufficient size, but often so weaken the vitality of the tree as to cause it to become a "shy bearer" the next year. With proper pruning and tainning these difficulties can be overcome to a large extent. We believe that props have no place in the orchard and are only a sign of very poor orchard management.

Study each tree individually, and thin so that at picking time the tree will hold up well under a load of uniform, good sized and well colored apples. Apples of the Winesap type should be thinned to a distance of from nine to ten inches. Fruit of a larger growing type could be left a little closer.

In thinning, take off all terminal apples on long, slender branches, and break all doubles. Take off all wormy apples and all those that are much smaller than the average. Take off all limb bruised or badly frost marked apples, and also those that are likely to become limb bruised as they grow in size. Leave the apples in singles and in such a position that they can have the best chance to grow in size, color and uniformity, and be as free as possible from blemish.—R. S. Herrick, Field Horticulturist, Colorado Agricultural College.

WHY AND WHEREFORE IN SOIL FERTILITY.

(Continued from Page 99.)

ting humus into the soil and making it like a sponge to hold it. A dust mulch will do this.

Maintaining Mulch.

Cultivate frequently and keep the dust mulch fine and break up the capillary tubes by which water is constantly being brought up from the bottom and evaporated away. Even though you have no rain to fall on that mulch and compact it, the pressing down of the soil on itself will form tubes unless it is broken up every week or ten days. If this is done and the surface kept like flour, no capillary tubes are established and we save much water.

The capillary rise of water is responsible for a certain amount of our water supply, but as a matter of fact we don't get much capillary water to our crops. The physicist knows that liquids travel up small capillary tubes, but there is another force that exerts an influence on this water, and that is gravitation which tends to drag it down. These forces work against each other and we get an equilibrium at a certain point depending upon the fineness of the tube, in soil, to the fineness of the particles. We know that this surface tension is not so great a force as gravitation and only to a certain point can it carry water. As a matter of fact our best alluvial soils, made up of fine particles, friable and easy to work, are the best carriers of capillary water to greatest distances in least time. For example, Imperial soils will carry water five feet in a period of about a month. This gives an idea of how small is the lifting force of capillary water.

Capillarity is important in another way, namely in power to carry water laterally in irrigation, to spread water laterally rapidly in considerable quantities. In the lighter soils this gives a quicker supply of water to the tree; in the heavier soils it is naturally slower. There are many things you can read on this point; there are many you can observe in your own fields and in your own grove. Look up Bulletin 10 of the Bureau of Soils by Lyman J. Briggs which gives laws and reasons for the importance of capillarity as a distributor of water, not a lifting agent.

Nitrate of Soda.

Dr. King says, as Hilgard has shown many years ago, if we apply nitrate of

soda, the nitrate is used up—that is what we apply it for—but the soda remains behind. In case of soils well supplied with lime carbonate or where we put under cover crops, the balance of that soda from the nitrate of soda forms a sodium carbonate, black alkali, which is a dangerous material, if it accumulates in sufficient quantities, plants will be hurt. But if the sodium nitrate is used only in small amounts, the small amount of sodium which is left will take years to accumulate in sufficient quantities to be harmful. While there is a constant loss of other materials by percolation there will also be a loss of sodium by the same means, so we cannot say that all the sodium remains behind in the upper layer of soil.

I know that for a dozen or more years some people have been applying enormous quantities of nitrate of soda in fairly heavy soils without bad results. In the Citrus Experiment Station at Riverside Prof. Norton has applied 25 pounds to the tree for four years without injury. One man has used 40 pounds to the tree. The common practice is to apply eight pounds to the tree. This is four times as much as I would recommend even on old trees.

At certain seasons of the year the soil is too cold and that is the time to use nitrate of soda, early in the spring. After all, nitrate of soda is a stimulant and produces more leaves and twigs than fruit and we should use only a small amount as a supplement to green manuring. Put on your nitrate of soda in two applications, one or one and a half pounds to the tree, don't go beyond three pounds to the tree during the season. If you want something to act quickly, use dried blood. In a cold spring like the past one you could not depend upon dried blood. I would put on a small amount of nitrate. The action of nitrate of potash is the same as that of nitrate of soda, but as it is much more expensive, it is not likely to be considered commercially for this use.

Local Experiment Stations.

Establish local experiment stations on your own place. We must know more about fertilizing and more about every citrus tree, for every tree of a certain kind differs individually from every other. We must know its requirements in water and fertilizer. We must make use of the observations which have been made for years by men who have made a study of the subject in order to avail ourselves of the best in citrus, but the fullest knowledge comes from individual observation of experiments under your own conditions, with a mind in a receptive condition which is able to interpret results and tell what they mean in practice.

Notes.

Don't try to have a summer cover crop unless you are sure you have an abundance of water to maintain your trees and your cover crop. Try it out first on one block in your orchard.

I would prefer to use dried blood in the spring and barnyard manure in the fall.

The nitrogen in a good grade of tankage is available earlier than that in blood.

Excessive cultivation tends to decrease the amount of humus, yet we must keep two or three inches of mulch.

Would prefer to fine ground bone, phosphate rock—untreated rock is cheapest—if you have a good green manuring crop. Plenty of humus means plenty of carbon dioxide, a weak acid in water, which dissolves the rock. There is no danger of using too much untreated rock.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

VALUES.

By Mrs. M. E. Sherman.

On all sides we are confronting increased prices in producing our crops, but no increase in returns. Wages are higher and everything the farmer uses, yet the people in the cities are full of the idea that if they can only get a piece of land that they can make a living from the start. It seems to me that the price of farm lands is being unduly inflated in consequence of this unreasonable demand. Take dairying alone in California, it would seem when the month of June gave a receipt of 2,036,600 pounds against 1,330,900 for June of 1910, or a gain of fifty per cent, that the creamery business was growing very rapidly. The prices of California butter were sustained in a measure by the market of the Northwest taking the surplus. This is the first time butter has gone out in a large amount for some years. Why?

The increase in the number of herds has not been as great as the increased production of the herds by careful selection. The use of pure bred sires within the past ten years is now showing up in the third generation, also the use by so many of the Babcock tester has resulted in the weeding out of the poorer producers. The many herds that a few years ago hardly averaged two hundred pounds of butter per cow are now reaching out to the four hundred mark. Many are far past the three hundred mark at present. The increased profits are not all used up as yet in increased costs. The first one hundred and seventy-five pounds the cow gives of butter is all taken to pay the costs, leaving only twenty-five pounds for profits. This profit may be non-existing for the cow that is not on the alfalfa field, but it will be recognized that even then it requires careful handling in keeping down expenses to make this amount. When the cow produces four hundred pounds of butter that gives two hundred and twenty-five pounds to be added to the profit side, then the dairyman buys an automobile to get the cream more quickly to the creamery.

Value.

The prices of cattle from established breeds of dairy animals have been very greatly increased. Indeed, so far, no year on record has the price run so high for pure bred stock as in the year 1911. In the Jerseys, the bull Jollys Royal Sultan brought at auction $10,000, while Noble of Oakland went for $15,000. The Jersey cow Majestys Lady Houpla sold for $3,425. A Holstein bull calf sold for $10,000. The sale of Ayrshires at Maxville, Ontario, made some record prices for that breed, forty-two cows selling for an average price of $407.50 each, while the bull Bargenock Victor Hugo brought $2,600.

Feeding.

After using a silo, lo these many years, for the first cutting of alfalfa, this season four more silos have been built near Fresno for the same purpose. The necessity has come, now, that the herd have been tested for butterfat of improving the feeding conditions. In the alfalfa regions of the state nothing can be grown that equals alfalfa in cheapness of production or that fed to the cows will produce as much milk. In Del Norte county, kale is being grown for the same reason, that of furnishing succulent food in the winter time. A Mr. Scarina reports having 45,000 kale plants for this winter's feeding. One plant with a small amount of hay makes a day's ration for a cow. The value of water to the cow's milk production is very great. The old way of salting her food to make her drink freely of water has given away to the wiser plan of feeding the water in the form of green foods. A cow that will milk ten thousand pounds of milk in a year will require eight or nine thousand pounds of water to carry the fats and other solids of the milk.

Tuberculosis.

The campaign against tuberculosis in cows has nearly arrived in California. The county boards of health are taking it up in earnest, and while mistakes in application may be made that will wrong some dairymen grievously, still it is right and in the end will benefit every one. It will increase greatly the value of tested cows, for until this time the fact that a cow had passed the test did not enhance her value in selling. If the city and town people had really wanted milk from tested cows badly enough to pay for it they could have had it long ago. The public must be educated to demand it and then it will not mind the cost. The increased cost to the dairyman will not increase his profits, as he will have to pay the money out at once for other things. The milker at forty and forty-five a month will not furnish his own white suits nor pay the laundry. It costs fifteen dollars a month to keep each man in white for the laundry work alone. Then for every sixty cows in milking, a man to groom them, clean stable and do general cleaning every day, while twice a month two extra men will have to be employed for whitewashing and other extra work around corrals. The city people need to be educated to the necessity of using the certified milk and then we will gladly furnish it at a price to cover the extra expense of tuberculin testing, and the interest on the money invested in cows that are condemned. In the past the trouble has so often been that the producer has been squeezed whenever any extra cost has been added. The publicity campaign on the use of certified milk will have the effect of putting the cost on the consumer.

DIP OR SPRAY FOR CATTLE.

By John M. Scott.

Every farmer, whether he owns one animal or one hundred, ought to be interested enough to protect his animals from the injurious effects of parasites. We have been using at the Experiment Station for the past year a dip which has proved quite satisfactory. The formula was prescribed by Dr. Nelson S. Mayo, and is as follows:

White arsenic, two-fifths pound; sodium carbonate, (crystals), one and

DR. B. J. KENDALL CO.
Enosburg Falls, Vermont

The Whiting Jersey Stock Farm Co.

Is making the very best strains of blood fresh from the island of Jersey a specialty. **Whiting Jersey Stock Farm Co. Heber, Cal.**

one-eighth pound; yellow soap, one and one-eighth pound; pine tar, one-half pint. Dissolve the arsenic by boiling it for half an hour in one gallon of water. Add the dissolved arsenic to five gallons of water. Shave the soap, mix it with the soda, and dissolve the mixture in one gallon of water. When dissolved pour in the tar, pouring in slowly in a fine stream, and stirring meanwhile so as to get it in solution. Then mix it with the arsenic solution, and add water to make twenty-five gallons in all.

This is to be used as a dip, spray or wash. It loses but little by age. The solution not only kills ticks, but also kills all other animal parasites with which it comes in contact. It may be applied either with a brush or a sprayer, or it may be put on in a dipping-tank through which the animal is passed.

Injury by Ticks.

One of the worst parasites with which we have to deal is the cattle tick, which causes Texas, or splenic fever. The loss among native stock from this disease is quite heavy; but perhaps most of the loss is caused not by the fever, but by the heavy drain upon the animal's system from the large quantity of blood taken by the ticks. One tick consumes only a small quantity; but the continued feeding of several thousand ticks upon one animal soon exhausts its constitution and vitality. This is especially true of young animals, such as calves from six weeks to one year old—a period when they ought to be making their best development and growth. If at this time they are feeding several thousand ticks, instead of growing and developing as they should they will actually become smaller. The young animal once stunted in growth will never develop as it would have done, if it had received proper care and treatment from the first. Besides suffering this loss of blood, tick-infested cattle suffer continuously from irritation and injury of the skin. The tick when attaching itself to the animal's body puctures the skin. The puncture is soon surrounded by an area of intense inflammation, which results in the formation of readily visible scabs.

Loss of Milk.

The injury to the live stock owner by the ticks is not confined to the loss of blood, and the irritation of the skin caused to his cattle. It has been estimated that the loss to the dairyman caused by the cows being heavily infested with ticks is equal to one quart of milk a day for each cow. This loss amounts in a year to no less than 275—300 (70 to 75 gallons) of milk for each cow. This means a yearly loss of $20—$25.

Much the same is true of cows on the range when nursing calves. The cow has to feed the ticks. Hence, if the ticks abstract the equivalent of one quart of milk a day from dairy cattle, doubtless they reduce in some similar proportion the milk yield of the range cow, whose calf must lose that amount, and the calf likewise suffers a corresponding drain from its own ticks. How then can we expect our cattle in tick-infested sections to develop as they ought to develop?

Eradication of Ticks.

Of course the best solution of the problem is the eradication of the ticks, and this could be accomplished if every live stock owner would co-operate with other live stock men.—Florida Agriculturist.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

USE OF THE CURRYCOMB.

Proper grooming, feeding and driving is all a horse needs to make him the noblest animal on earth; therefore be generous in the use of the comb and brush, especially the brush. In using a currycomb, see that the teeth are not bent. Such a comb is an instrument of torture. Teach the boys to use it gently, as many horses are given ugly tempers by cruel and careless currying. To hurt a horse will cause him to hate the operation and the operator.—Horse World.

High-priced land, high-priced labor and high-priced feeds are making it mighty hard for the dairyman who has to rely on low producing cows. The average American cow is said to produce about 150 pounds of butter a year, a five-dollar calf and a few dollars worth of skimmilk. Even at 30 cents a pound for butter you cannot figure her annual gross income over sixty dollars a year. Feeding such a cow ten-dollar hay, thirty-dollar bran and scurrying all over the country to find men who will engage to milk cows is not an encouraging business and no wonder so many people quit dairying.—Coleman's Rural.

Read and think. Observe your own and neighbors' cows; put into practice all the good things learned from the reading and from observation. There is no danger of keeping things too clean.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Sidebone.

A young horse has a hard painless lump on one side of his foot just above the hoof. The horse is not lame. Ringbone feared. Kindly advise treatment.—Subscriber, Whittier.

This is probably a sidebone. Sidebones which do not occasion lameness require no treatment except careful attention to shoeing.—F. G. M.

Lameness.

My horse is lame part of the time from a sore which started at the frog and has now extended to the front and upper part of the foot. A watery substance oozes from the foot and occasionally a heavy white matter flows.—Subscriber, Covina.

Your description does not explain whether the horny wall is separating from the flesh, but I presume this to be the condition. This being correct, have your horseshoer cut through the sole directly below the point where white matter appeared and if water is encountered enlarge the opening and inject hydrogen peroxide once daily.—F. G. M.

Swelling on the Jaw.

A young milk cow, due to calve in six weeks, has recently developed a hard, painless swelling extending almost the entire length of the jaw. She coughs occasionally. Should we separate her from the other cows or use the milk?—Subscriber, Beaumont.

Lump jaw is suspected in this case. Dissolve two ounces of iodide of potash in a pint of water and give two tablespoonfuls or one ounce of the solution twice daily in the feed. Skip a week and repeat. I hesitate to advise the use of milk from afflicted cows unless I am certain the disease is benign. There is little danger to other cattle while there is no discharge.—F. G. M.

Sugar-Beet-Pulp takes the place of green grass and is the best butter producer in the world. 50 cents per ton at Los Alamitos Sugar Factory.

Small Fruits and Vegetables

THIS MONTH.

This month offers the least inducement to garden work of any on the calendar. Excepting under most favorable conditions, the heat will prove too much for seeding of any except hardy plants. Of course an abundance of moisture down deep in the soil will aid materially with all plants. Succession of lettuce radishes and similar hardy plants, if covered when planted so as to give the seed a chance to send the young sprouts through the soil, will make succulent growth which affords a most acceptable addition to the midsummer table. Peas, onions, celery, cabbage and cauliflower may all be planted. The first sowing of tomatoes for the winter crop may be made this month, planted in flats or in protected seed beds. This is the month for the planting of the second or fall crop of potatoes. For this only irrigated land is possible. Prepare the soil by deepest and most thorough of irrigation and plow deeply and put in thorough tilth.

Blackberries, raspberries and loganberries may all be given their summer pruning. Blackberries and raspberries should have all canes removed which have borne the last crop. This gives more room for the young shoots which are coming for the next crop. If these are growing too lustily pinch back to force branching and consequent greater fruitfulness.

GIVE PLENTY OF DISTANCE.

Many gardeners make the mistake of crowding garden vegetalbes too close in the drill. Vegetables require rapid growth and quick maturity to give quality and flavor to the plants when served. Unless the soil is exceptionally rich and there is plenty of soil moisture available during the growing season, the plants are apt to be dwarfed and the quality of the vegetables impaired.

In producing vegetables for the market, the grower will endeavor to grow plants of high quality and desirable flavor, and he cannot afford to take any risk. It is far better to produce fewer products and gather vegetables of better quality than to have an abundance that do not command fair prices.

The safest plan is to sow plenty of seeds in order that a good stand may be secured. If the plants are tender and the spring is favorable for the insects, diseases, cold nights, etc., leave about twice as many plants as you desire to grow. When the weather is favorable for the growth of the plants, thin promptly, leaving the required number of plants. Be sure that the plants have sufficient distance to produce vegetables of extra quality.

CUCUMBER AND THE SQUASH BUG

It angers the gardener often beyond endurance to nurse up a bed of cucumber and squash seeds and then see the squash bugs and cucumber bugs swoop down in armies and clean up the whole patch. When you battle with a cucumber or squash bug you've got a tough customer and one that can put up a stiff fight. There are those who tell us to sprinkle our vines with cayenne pepper and watch for results. The impression here given is that the bugs get a whiff and cough and sneeze themselves to death. The average gardener wouldn't care about that if it was a means of getting rid of the pest.

SETTING STRAWBERRIES IN THE FALL.

By Q. A. Lobingier.

Whether it is wise to attempt it depends upon several things. If you have your ground in fine shape and plenty of water at command and under control so that you can use it in large or small quantity, and extra well-rooted plants, and the weather is not too hot, you may succeed fairly well. If one only has a few plants to set out it can be safely done by removing each plant with a ball of earth; and while this is a slow, tedious process it is a pretty safe one, if followed by immediate watering. But in setting out in large areas, with all my experience I would not think of attempting it unless I had plants that had been layered in pots.

It is not possible to have the strawberry plants in a dormant condition before January and I know of no plant more difficult to transplant into the open field during such hot weather as we are likely to have throughout the fall, if it cannot be done without disturbing the roots. I have been uniformly successful with plants from pots, and if set as early as August 20th and well cared for until the holidays, you can expect a fine crop of fruit the following spring. Set even as late as November 1st they will grow more or less throughout the winter and a partial crop can be expected the following spring. While this growth will not manifest itself in the foliage it will in the root development. I always plant on a level surface and mark out the rows 20 inches apart, and set the plants 12 inches apart in the row. I have found the method to be of more advantage in picking and irrigating than any other—and I have experimented with about all of them. As to variety, almost every locality has its favorite. For Southern California the Brandywine is the leading variety and has been for the past ten years. Recently the Klondike has been largely grown and is an earlier berry of great excellence, but does not bear for as long a time during the season. The strawberry is not a tropical plant and newcomers or beginners will need to go a little slow in engaging in strawberry work on a commercial scale in the interior hot valleys. A little investigation will demonstrate that you will not find the business flourishing very far back from the Coast. This is not to say that it is not possible to have strawberries in many of the interior valleys, but the risks from heat are so great as to make commercial success very uncertain.

TOMATO BLIGHT.

When I noticed my tomato plants beginning to blight this season I tried the experiment of taking equal parts of lime, wood ashes and sulphur, sprinkling it on top of the ground and over the plants, and put small piles of manure in the ditches so the water would seep through them. This mixture was put on two or three times during the season, very few of my plants died and I have fine tomatoes now.—Mrs. A. J. Jordan, Reedley.

The honey flow of Kings County is reported materially later than usual, but output larger than anticipated.

The Ornamental Garden

THIS MONTH.

This is a trying month in the ornamental garden and one in which few new plants are started. The best of care must be given to those which are already established, especially thorough and deep irrigation and cultivation to all excepting the most hardy shrubs or trees. The lawn needs more water than during perhaps any other month of the year and best of care now will aid in preventing the rapid spread of Bermuda, but if the blue grass is not given sufficient water, the Bermuda will take advantage of the opportunity.

During this month sow pansies and stocks in the seed bed for pricking out later. The seed should be covered very lightly and burlap laid over the surface to prevent baking. It should be kept moist practically all the time. When seeds are up lay off the burlap, but be sure to shade the ground with lath or cloth frame a few inches above the ground. Salvia, Chinese pinks, petunias and verbenas may all be sown the same way this month.

The violet bed should be given attention, the old plants divided and new ones replanted. Golden glow and goldenrod are just coming into bloom and require to make richest flowers an abundance of moisture. Shasta daisies have about ceased blooming and may be trimmed, as the younger shoots will make fall growth if fertilized and irrigated. Gladiolus and Watsonias should be taken up this month if the bulbs have ripened, as they have in all the earlier planted bulbs.

A HINT FOR FLOWER GARDENS.

California has much to be thankful for in the line of natural advantages in flower culture, but we do not live up, or practice up, to its possibilities. A French hint noted in the London Daily Mail may be of value.

"Even more wonderful is the forcing of orange blossoms, which is conducted on a large scale in another part of Paris, Charonne. This business belongs to a family which has a secret, handed down from father to son, for producing the orange flowers at any time of year, just as they are called for. At all big weddings in Paris the hymeneal blossom still lends splendor to the bride's adornment and fills the church with its fresh, delicious scent. They come in most cases from the orange groves of Charonne! In a number of places round about Paris roses are grown under glass in winter; wallflowers, too, and violets and lily-of-the-valley. And many of them go to the south. Do they come back as "Fleurs de Nice," I wonder! I shall doubt that notice when I see it in the florists' shops in future, though the flowers will be just as dainty and desirable although they were grown close by.

"Surely here is a hint for enterprising florists. The market for spring flowers in winter is both steady and profitable. If lilac can be brought to flower in Paris through the dark months, why could it not be equally well produced near London? Why not add to "French gardening" this excellent French flower industry? Capital is required, and, still more important, scientific skill wedded to ceaseless care. But with lilac at half-a-crown a spray, the outlay and the labor would both be well rewarded. Even if we have not the genius of our quick-witted neighbors, we can surely follow where they have led. We cannot rival the natural early flowers of the Riviera, but we might do a good deal to compete with the Paris forcing houses and keep the money we spend on winter flowers in our own country instead of sending it abroad."

THE FRENCH FLOWER TRADE.

January is the desolate time in our English gardens. It is something if even the tiny golden cup of the winter aconite gladdens the brown soil; if, here and there perhaps, a fragile polyanthus, born before its time, perks up in the morning sunshine. Yet there is no season of the year when the flower shops draw our gaze with a show more rich and rare. Tall branches of lilac enchant us with their delicate beauty. The downy yellow blossom of mimosa perfumes the air. Great bunches of roses are displayed alongside of proud carnations and the virginal narcissus. Orchids and azaleas, giant cyclamens and the sturdy little button anemones, tuilps and the last glories of the chrysanthemum time, all combine to conjure our money out of our purses that our rooms may help us to forget the dun sky of winter and the bare earth outside.

It is in Paris that the flower shop especially flourishes. There are so many there that one can count upon never going many blocks without coming across one. Even on the open-air stalls one finds exquisite arrangements of quite expensive flowers. Under the shadow of the Madeline I walked yesterday between two lines of booths where hundreds of pounds' worth of roses cried aloud to be bought. This morning close to the Arc de Triomphe I bought lilac and carnations and big, sweet-scented lilies of the valley off a little street corner erection. In London one knows all the flower shops—there are so few; and the street sellers are content to appeal only to the purchaser of very modest means. One reason for this is that most of our flowers in London come from France, and are therefore dearer because they have further to travel. A certain amount of forcing for the early market is done in England, but the great bulk of the supply is sent to us from across the Channel—from the gardens which lie all along the Cote d'Azur from Hyeres to Vintimille.

The Flower Train from Nice.

Have you ever seen the flower train leaving Nice at one o'clock in the day? A long train it is, and as the spring advances it grows longer still. Every van is filled with a fragrant freight. The flowers are packed with the greatest care, and though they do not reach England till the next night, they are almost as fresh when they arrive as when they are gathered in the sunshine from the terraced gardens which look down upon the sparkling sea. Between November and May last over two thousand tons of flowers were sent to England from the Riviera by way of Marseilles and Paris. Even a pound of flowers represents a great many, so light does their delicate beauty weigh.

During the last few years Germany, becoming more prosperous and luxurious, has increased her flower purchases at a very rapid rate. Now she takes from the Riviera almost half as much again as England, whereas in 1903-4 she took only half as much, and even in 1906-7 the amounts were equal. Thus today Germany spends upon Riviera flowers nearly three times what she spent six years ago.—London Daily Mail.

Fresh Avocado Seed
(Alligator Pear)

For July and August Delivery, $4.00 per 100, $35.00 per 1000 by express, and instructions for planting, etc., with each order.

WHY you should have
A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

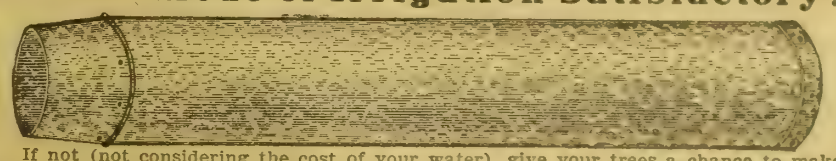
Kellar-Thomason Manufacturing Co.
1226 East 28th Street, Los Angeles, Cal.

Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

THE AMES IRVIN COMPANY Corner Eighth and Irwin Streets, San Francisco, California

Why Experiment with Inferior Pumps?

Buy a pump built on the Pacific Coast, and adapted to your needs.

Our pumps have been in use and on the market for years, and have stood the test of time.

Buy direct and save freight and jobbers' profits. Live, erecting agents wanted. Our retail prices are less than our competitors wholesale prices.

CONTENTS THIS WEEK

BIG BRIDGE NEAR PALO ALTO, Cover.

WHY AND WHEREFORE IN SOIL FERTILITY, 99.

CITRUS AND TROPICAL FRUITS.—Cooperation; 100, 101.

DECIDUOUS FRUIT CULTURE.—Apple Crop Injured; Thinning Apples; 102, 103.

LIVE STOCK AND DAIRY.—Values; Dip or Spray for Cattle; Use of Currycombs; 104, 105.

SMALL FRUITS AND VEGETABLES.—This Month; Plenty of Distance; Cucumber and Squash Bug; Setting Strawberries; Tomato Blight; 106.

ORNAMENTAL GARDEN.—This Month; Hint for Flower Gardens; French Flower Trade; 107.

EDITORIAL.—Original Stuff; Sweating Fruit; Farmers Institutes; Walnut Blight Cure; 108.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 109.

PROFIT IN THE POULTRY YARD.—Millions in It; Pears; State Federation of Poultry Associations; 110, 112.

QUESTIONS AND ANSWERS.—Mildew in Grapes; Prolapsus of the Oviduct; Temperature for Loquats; Hogs Eating Chickens; Yellow Leaf; Fall Strawberries; Humus, Sorghum Poisoning; Belgian Hares; Morning Glory; Measuring Water; 113, 114.

IRRIGATION AND FORESTRY.—Irrigation Points; 115.

HOUSEHOLD.—Her Last Poem; A Prince, a Princess and a Beggar Maid; 116, 117.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 118, 119.

ORIGINAL STUFF.

There is no doubt that at times the shears and the paste pot supply some remarkably good material for every farm or other kind of paper. Some of the good things in this week's Cultivator are clippings made from other well edited papers, but from a California standpoint such material which is of value is hard to get, for some of the departments at least, and in any case we believe the matter of greatest interest is that which is furnished by people of our own section who have to do with the problems which more immediately concern us.

To the end that as much as possible of this material may be had for the columns of the Cultivator, we have repeatedly drawn upon practical workers here and there over the state, and no issue of the Cultivator comes out without some of these writers being represented in our columns. Especially do we wish to refer to last week's issue, in which over twenty-five columns was read for the first time by subscribers of the Cultivator.

We hope every citrus grower in the state saw the article on withertip by Prof. Smith of the Southern California Pathological Laboratory. Prof. Smith is an investigator who does not form his conclusions hastily, and whatever he furnishes is of the very best. Mrs. Sherman again chatted with our live stock subscribers, speaking of the securing of registration for every animal entitled to it. Mr. Harry L. Murphy, of Sacramento County, spoke a good word for his favorite breed, Berkshire hogs. Prof. Shaw comes to us with two articles, one on cane and beet sugar, and the other an appeal for greater attention by Californians to the Sixth International Dry Farming Congress. Mrs. Basley's "Ducks" gives what many subscribers have desired, valuable information regarding the money maker, poultry. Questions and Answers was a material part of the issue, and from the commendations received for this department, we believe it is one of the most valuable features of the Cultivator. Some questions come to this office which are trying, in that they do not give full particulars for intelligent answer, but as a rule much intelligence is manifested in the asking of questions, and we try to secure the answers from those who are fully qualified.

All told, we do not think last week's number has been excelled in worth, excepting by some special issues. We make no promises for the future other than to assure our subscribers that every issue will be held up to the highest possible standard.

SWEATING FRUIT.

A new regulation of the pure food division of the Department of Agriculture declares that "sweated" oranges are adulterated under the provisions of the pure food act. Now, the question may not embarrass California growers very much, but the Florida growers are up in arms. Florida fruit sweetens so as to be palatable before the rind of the orange colors. This backwardness of coloring has been remedied by placing the fruit in close rooms and subjecting to moist heat for two or three days, or "sweating," to give the color acceptable to the eye. The ruling of the department will prevent this, and it is doubtful if the Eastern trade will accept the green colored fruit, for we all know that we buy fruit with the eye.

We are not informed as to whether the same ruling will obtain as to lemons or not, but as the value of a lemon is in its acid rather than its sugar, we imagine there will be no objections. True, lemons are seldom sweated. California has been guilty of sweating to a limited extent only, and we do not think the new ruling will affect the trade of this state, but strictly, as the ruling stands, it may force a settlement of the question as to what "sweating" really is. Presumably the term is applied to the process where the fruit is subjected to artificial heat and moisture for a period in a close room, but as a matter of fact nearly all are sweated before being sent to the market by simply allowing the natural "sweat" which forms after the fruit is placed in the packing house.

FARMERS INSTITUTES.

J. B. Neff, Conductor of Farmers Institutes for Southern California, announces the first institutes of the season to be held in San Diego County. The dates are: La Mesa, August 14; Lakeside, August 15; Ramona, August 16; Little Landers Colony, San Ysidro, August 17. The latter place, by the way, is near Tia Juana, on the line between California and Mexico. The "Little Landers" are believers in intensive farming and securing from a small tract of land a living for a family, instead of attempting to farm a large amount of land indifferently.

Other institutes to be held are on the following dates: Orange, August 18-19; Gardena, August 21.

WALNUT BLIGHT "CURE."

A Santa Barbara County walnut grower claims that the spraying of walnut trees with sea water is a complete remedy for walnut blight. We hope the belief of this grower will prove to be well founded, because there is little question the supply will be sufficient to effect a permanent cure of this dreaded trouble. We would not, however, advise very long shipment of sea water to use for spraying purposes.

Two other formulas are recommended by the same grower. One consists of a weak solution of bicarbonate of soda mixed at the rate of "one teaspoonful to each cup of water." In lieu of the sea water a solution of salt will answer.

The State Agricultural Experiment Station has just issued Circular 65, the California Insecticide Law, written by Prof. C. W. Woodworth. It has to do with the new insecticide law and its requirements. Further, it refers to the chemical analysis of various insecticides which will be made by the chemistry division of the State University. Everyone having to use insecticides should write for this circular. Regarding the new law Prof. Woodworth writes:

"This law, which has just gone into effect, requires all manufacturers or dealers to properly label and guarantee the purity of all such substances, provides severe penalties for its violation, and prohibits the sale of such goods until the dealer shall have complied with the requirements of the law.

"Any user of insecticides or fungicides can now have the material he buys examined by the University upon the payment of a nominal fee, and thus learn whether it conforms to the guarantee of the dealer."

Circular 66 of the University of Califorina College of Agriculture, by Prof. H. J. Quayle, while of only seven pages, has a world of information on sprays. In fact, it is almost a complete spray calendar, having twenty formulas for treating the various pests of agricultural crops.

We note that an Eastern exchange, in boosting for its state fair, says, "The state fair is the advertising agent of the state." If California had depended upon its state fair to be its advertising agent it would never have reached the position it has. President McKinley said, "Fairs and expositions are the time keepers which mark the progress of states and nations. They record the world's advancement." California's state fair may succeed in being a recorder of the state's advancement; we sincerely hope so.

The Eastern farm press is urging the farmers to plant soiling crops to make good the loss of pasturage and meadows from the intense heat and drouth. This is a case where we may call the Easterners' attention to their oft-repeated claim that they do not have to irrigate. Californians have always felt a far greater security in carrying out their slogan which is that California farmers do not have to go without irrigating.

Clover seeded this year in almost all sections has been a complete loss and reseeding is urged at once.

Referring to the fact that Florida has no laws to protect the fruit interests of that state from the entrance of pests, the Florida Fruit Grower speaks of the California horticultural law as a splendid one, and adds: "It is to that state we must look for protection against fruit pests, the fruit fly which may come into this country from Hawaii and through California ports." Fortunately, California has been alive for years to the danger, and her vigilance has protected us so far.

Mr. Powell's investigations in the fruit sections of Italy developed the fact that labor in that country is about one-fourth to one-third as expensive as in California. The cost of transportation to our markets is also about one-third the cost to our growers. It may be readily imagined what the results will be from the removal of protection on citrus fruits.

The crop Reporting Board of the Bureau of Statistics reports 115,939,000 acres of corn planted in this country this year. Compared with 1910 this is 101.7 per cent. The condition on July 1st this year was 88.1 as compared with 85.4 the same date last year. Plainly, with the drouth which followed July 1st for some time, the output will be greatly lessened.

A. V. Steubenrauch, of the Bureau of Plant Industry, has issued a leaflet on "The Relation of Handling to Decay of California Navel Oranges." It has to do only with the past season's investigations, and is material along the line of the work conducted by G. Harold Powell some years ago.

In a tree planting contest in Pennsylvania some weeks ago one horticulturist is reported to have planted and tramped in the dirt about 61 trees in ten minutes. As we say, this was some weeks ago, and we would be glad to hear with what results to the trees. We imagine there was not much fingering of dirt into the rootlets. The record by individual minutes is: first minute seven trees, second minute six trees, third minute six trees, fourth minute six trees, and so on.

The Panama-California Exposition at San Diego is planned to be run the entire year of 1915.

Agricultural News Notes of the Pacific Coast

Northern California

Vacaville is already shipping early grapes.

The first car of grapes shipped from the state sold in Chicago for $3400.

The first hops of this season were sold at Wheatland, Yuba County, last week.

Another boy's dormitory is to be constructed at the University Farm at Davis.

The flea beetle is threatening serious injury to vineyards of Yolo County.

Sacramento has voted $75,000 to improve the channel of the river below that city.

The output of almonds from Butte County will be far larger than any preceding year.

Walnut Creek, Contra Costa County, is planning for a Grape Festival to be held October 7th.

A dairyman at Woodland, Yolo County, has just added 17 registered Holsteins to his herd.

Fresh fruit growers are elated over the prices which have been obtained through the whole season.

Truckee, Nevada County, is planning for a snow carnival to be held sometime during the coming winter.

Preparations for the great Gravenstein Apple Show at Sebastopol which will open on the 14th are nearly completed.

The prize Jersey cow of California, which has been owned by the University Farm, recently choked to death on a carrot.

The Alameda Sugar Company, at Alvarado, is contemplating moving its factory to some section in the Sacramento Valley.

Irrigated beets near Willows, Glenn County, are making wonderful growth and promise is made for a most profitable season.

Grain warehouses at Butte City, Glenn County, will soon be filled with over 100,000 sacks of barley and 15,000 sacks of wheat.

Black caterpillars have been so plentiful at McCloud, Siskiyou County, that railway trains were stalled owing to "greased" tracks.

The output of tomatoes from Marysville, Yuba County, has increased until it has become one of the great factors of that section.

Wells on the Hagen Grant near the city of Sacramento, are cause for hope that the great tract is underlaid with sufficient water so that irrigation by pumping will be possible.

The Sacramento Ramie Company is to construct a factory for the handling of this textile and it is estimated that within the year 15,000 acres near Sacramento will be growing this crop.

A great concrete siphon is to be built under the tracks of the Southern Pacific at Willows, Glenn County, to conduct the water in the canal of the Sacramento Valley Irrigation Company.

The Sacramento Valley Irrigation Company has let contracts for the removal of over a million cubic yards of earth in the construction of irrigation works in Glenn and Colusa Counties.

Central California

The Santa Cruz poultry Show is declared to have been a great success.

Lodi tokay grape growers anticipate big returns from the coming season's output.

Poison spread for squirrels is causing death of many droves in San Benito County.

Tulare County peach growers have been offered ten cents per pound for first grade dried peaches.

A drainage canal is to be constructed near Kerman to carry storm water into the San Joaquin River.

A. C. Pears, of Tulare, and Dick Lipscomb, of Visalia, are appointed Tulare County dairy inspectors.

Reedley, Fresno County, reports its fruit crop as exceptionally good quality and commanding best of prices.

Combined harvesters once common in the section of Exeter, Tulare County, are now scarcely ever seen.

Meetings are being held at Fresno to consider the organization of the raisin growers under the Nutting plan.

Commissioner Sharp of Kings County is inspecting all shipments of Utah alfalfa seed, looking for alfalfa weevil.

Fresno has 10,000 tons of ice stored for fruit refrigeration. The first special fruit train service started last week.

Squirrel Inspector Howard of Kings County thinks there is an opening for contractors to rid lands of the squirrel pest.

The first full car of fruit ever shipped from Kerman, Fresno County, to the eastern markets was forwarded last week.

Watermelon growers at Dinuba, Tulare County, are fearing material loss because of attack of blight in many of the fields.

The Pajaro Valley Poultry Association is planning for an exhibition October 11-14. This is during the Apple Annual week.

Tulare County board of supervisors has passed an ordinance prohibiting the shipping into the county of any diseased cattle.

The newly organized Pajaro Valley Poultry Association celebrated its birth by a chicken banquet at which 200 were present.

Owing to extensive planting of alfalfa at McFarland, Kern County, plans are being made for the starting of an alfalfa meal mill.

Santa Cruz County treasury being short of funds, Horticultural Commissioner Volck has agreed to waive his salary for the month of June.

Small wine grape growers of western Fresno County, controlling something over 400 acres, will pool their interests and sell to one purchaser.

The Valley Grain and Warehouse Company operating warehouses at Orris, Ducor, Terra Bella and Lois, Tulare County, estimates for those sections 180,000 sacks of grain.

Santa Clara Valley is planning an exhibit at the 1915 Exposition which shall consist of a miniature trolley line carrying passengers through canvas depicted scenery showing the orchards and gardens of the entire valley.

Southern California

The Oxnard sugar factory began its beet slicing July 27th.

The Long Beach Poultry Association is making plans for its next poultry show.

A Ventura County bean farmer has patented a machine to bunch or pile the bean vines.

About 40 per cent of the grape crop of the Escondido Valley is sold in the city of Los Angeles.

There will be a heavy planting of apple trees in the Yucaipa Valley, San Bernardino County.

The West Ontario Citrus Association has been formed at Maerod, between Ontario and Pomona.

Escondido has appointed her Grape Day directors and a great celebration is planned for September 9th.

Los Angeles, now the richest county west of Chicago, has an aspiration to be the richest county in the world.

Butterfat prices, which have stood at 22½ cents in the Imperial Valley, were advanced last week to 24 cents.

Experts are advising Imperial Valley farmers not to plant walnuts owing to the extreme aridity of the section.

The Chino Ranch farmers in San Bernardino County will receive about $150,000 for their sugar beet output this season.

The big cotton seed oil mill at El Centro has made preliminary runs and is now practically ready for the season's run.

The temporary officers of the new Imperial Irrigation District are: Fritz Kloke of Calexico, chairman; Earl C. Pound, secretary.

The Chino sugar factory will have a beet pulp drying department completed in time for the handling of the pulp for this season.

The Anaheim Union Water Company has been formed by the union of the old Anaheim Company, the North Anaheim Company, the El Cajon Company and the Farmers Ditch Company.

One of the most disastrous forest fires in the history of Southern California burned for over a week in the Sierra Madre mountains north of San Bernardino and west as far as the mouth of San Antonio canyon.

Agents of a colony of Mormons have been investigating lands in the valley of the Cuyama River, and it is expected that storage reservoirs and development of other irrigation possibilities will make this one of the garden spots of Santa Barbara County.

A petition is being circulated in the neighborhood of Brawley for continuance of distribution of lady birds by the state horticultural commission. These beneficial insects are gathered every year in the Sierra Nevada east of Sacramento and placed in the Imperial melon fields.

Efforts are being made to construct a new ocean boulevard along Ventura and Santa Barbara Counties' ocean front. It is stated that this will straighten the lines of the highway so as to save nine miles in the distance from Ventura to Carpinteria. The plan will give over 30 miles of ocean boulevard.

The Coast

Helix, Oregon, reports magnificent growth of spring wheat.

North Yakima peach growers are selling their crop at about 60 cents per box.

The jute mill at the Washington penitentiary is turning out 7000 grain sacks daily.

Plans are being made for an agricultural fair to be held at Buhl, Idaho, in September.

Two hundred sacks of recently harvested grain burned at Pendleton, Oregon, last week.

Two large irrigation projects are being planned for Northern Humboldt County, Nevada.

Hermiston, Oregon, promises an immense grape yield. This is the first large crop in that section.

Idaho sheepmen are complaining at the extremely low prices being offered for spring lambs.

Vetch seed growers at McMinnville, Oregon, are finding greater profit from that crop than most any other farm crop.

Eastern Washington grain growers are complaining because of extremely high prices and short supply of grain sacks.

Grain growers at Goldendale, Washington, are making a fight in behalf of shippers of the Klickitat Valley for reduced freight rates.

Grain and all other crops on a strip of land four miles wide were recently destroyed near Miles City, Montana, by a terrific hailstorm.

The Canadian Pacific has made a material cut on the freight tariff on apples to all points in Canada. The cut amounts to 25 to 40 per cent.

Union County, Oregon, is in the midst of the greatest harvest ever given to that section. The county will produce about two million bushels of wheat.

Cocoons of an insect believed to be the brown-tailed moth have been found in orchards near Seattle. This is the first of this pest west of the New England states.

The Salt Lake Valley of Arizona is finishing its harvest of the biggest crop of sugar beets yet produced. In addition the sugar content is higher than in past years.

A Colorado cantaloupe grower has learned that by a system of pruning his vines he can more than double the production per acre. He plants very close together, then prunes back severely.

The Wenatchee Valley Orchard Company is installing an immense pumping plant which will lift the water 860 feet. This is said to be the record lift for irrigation purposes on this continent.

The law passed by the legislature of Washington which made it possible to collect cost of removing various weeds from ranches a lien to be collected at the same time as taxes, has been declared unconstitutional.

Franquette walnuts at Sheridan, Oregon, are showing excellent growth and promise to bear well. The next meeting of the Fruit Growers Association of that section will discuss the matter of more extensive walnut planting.

Profitable Poultry Feeding

can only be accomplished by the right kind of food at the right price

You can experiment—and learn by losing part of your flock.

You can guess—and learn by getting only a few eggs.

But without experimenting and without guess work you can have good, strong, healthy hens and plenty of eggs at a season when eggs are bringing a high price if you will feed

Coulson's Egg Food

It is a scientific mixture of egg producing materials and has been tried for years with universally satisfactory results.

It is for sale by all reliable poultry supply houses.

Insist on getting COULSON'S if you want the most for your money.

Interesting poultry books mailed free for the asking.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

MILLIONS IN IT?

By Mrs. A. Basley.

Millions in it? There are two sides to almost every subject. One says, "There's millions in the chicken business," and another asserts that "There is nothing in it." Which is right?

Statistics show that there are millions of hens at work and billions of eggs laid, so there really must be millions of dollars in the business as the report of the Secretary of Agriculture shows, but they are not all in one place nor under the control of one man or even a few. When we talk of billions or even millions few can comprehend the magnitude of such numbers applied to so small a thing as an egg. We really cannot "take it in." Just as we cannot "take in" the vastness of the ocean, or the number of the stars. We just have to accept the fact. Though the poultry industry, the raising of fowls and the output of eggs be enormous in the aggregate, yet it is composed of small things, occupying small spaces scattered over many localities and giving employment to hundreds of people many of whom are women and children. The poultry business is one of the biggest little businesses of this country and worthy the consideration of full grown men and women of mature minds and good business ability. In fact, some of our most successful poultry raisers are those who have brought to the work an educated mind with the judgment and ability gained in other lines of business. Yet there are others also to be found who have been successful in the mercantile field who have found the little chicks too much for them.

Eggs and fowls are no longer considered as luxuries, they may be classed as staples and the demand for them is greater than the supply. Ask any business man "Is there money in any commodity where the demand is greater than the supply, and hear him laugh.

It does not take an expert mathematician to figure out that a shortage in the supply and an increased demand mean good prices for all the good stock that has been produced in California this season as well as for purely commercial stock and market eggs. There is no doubt about it and housekeepers will realize this acutely as the prices of those little insignificant eggs go quietly soaring higher and higher this fall. The outlook for housekeepers is not so alluring, but for the poultry raiser, for the raiser of a "few hens" in the back yard this will be a banner year.

Still there are some who will miss the opportunity, some who do not have the "stick-to-it-iveness" that is an essential in the poultry business. Too many people are easily discouraged and while they may start out with absolute confidence in their ability to succeed they succumb to the first adverse wind, give up in despair and vote the whole business a failure. Now what man has done man can do again, and with the constantly increasing demand for good poultry and poultry products and also for high class exhibition poultry, there is no good reason why a hundred more extensive poultry plants should not be built up within the next few years in Southern California, and every one of them prove profitable to their owners.

August was the most discouraging month in the poultry yard for me. In August the old hens were commencing the moult, the pullets were only beginning to lay, the hens looked shabby and apparently felt as uncomfortable as we would in an old worn-out faded dress, there were feathers blowing about the yards or heaped in a corner or lodged between the fences and although the yards were swept once or twice a week it was difficult to keep the feathers down. Then to cap the climax August was the month of the smallest cash returns and the receipts did not cover the food bills. August is the month to be met with grim determination not to give up. I could almost have sympathized with a man who came to see me one August, who told me he did not bother about his hens in the summer, for they did not lay, he "just let the blamed things rustle for themselves." Poor things, just when they needed special care and attention.

In the months of August and September there is apt to be the greatest mortality among the old hens and the pullets to be raised for winter laying can easily be "put out of business" by neglect of their comfort. Lack of shade in these warm days is a common cause of failure to keep the pullets in good condition. Lack of clean water, shaded from the sun, is another cause, for when the water becomes warm it is a good medium for the culture of all sorts of harmful bacteria and diseases of many kinds may be traced to the impure water. Plenty of green feed is another requirement in these warm days and above all cleanliness in the houses and freedom from vermin. A little lack of attention, some few days of neglect may destroy all you have labored for and done during the breeding and hatching season. It is like running a race and quitting before reaching the goal when success was so near just for the lack of making an effort at the time it is most needed. When your enthusiasm begins to wane and you become too tired to do the little but necessary things for your chickens remember that next season's prize winners get the finishing touches put on in the next two months. It will be too late and you will have missed your opportunity if you neglect your chance now.

HARES.

By Daniel E. Caldwell, Los Angeles.

The rabbit's value as an economic factor in the pressing problem of the world's food supply has been demonstrated and insures the permanence of the industry to the breeder for the market while his value to the fancier is apparent when one is acquainted with his beauty, intelligence, docility and habits, points which delight the heart of the fancier.

We are firm believers in the success of the rabbit industry, but in this, as in things of a like nature, conservative talk and figures must be dealt with. Rabbits are without doubt much easier to raise than chickens,

$AVE MONEY ON DAILY NECESSITIE$

All Prices Greatly Reduced Through Our New and Improved Methods of Modern Merchandising

The Why of It

Solely for the special reasons of its advantages to you and us. Through this new method, "direct to you," we have wonderfully enlarged our output and as well our buying opportunities, creating lower prices in every instance.

Your Part of It

Your savings on the groceries you buy, on the farm implements you need, and upon the very clothes you wear, may be made a worth while item if all purchases are centered here. Cooperate for your own advantage.

Your Neighbor, Too

Little can one farmer realize just what methods of economy his neighbor is practising—the buying is very important, and those of your nearest neighbors who are buying of us are harvesting an economy crop worth while.

Great Economy

It is only recently that we have inaugurated this better merchandising method. The actual savings and wonderful economy are now within your easy reach. Look over the following lists carefully—every item a money saver.

Buy Direct and Save Middlemen's Profits

Animal Matter a Necessity For Poultry

Experiments at various State Experiment Stations have demonstrated beyond a doubt that Protein derived from an animal source is far superior, as an egg producer and flesh builder, to Protein derived from a vegetable source.

Our High Protein "Special" Beef Scraps Will Supply That Necessity

If your dealer cannot supply you, write us, and we will send you samples and price.

Made in California from fresh Packing House Products. Look for the word "Special" in red ink on every sack.

Western Meat Co., San Francisco, Cal.

and while we can not expect them to suplant the poultry interests, nor do we want them to do so, yet we opine that this line of culture can and will become a strong ally of the poultry business.

The nature of the rabbit to reproduce its species so rapidly makes it possible to raise them in great numbers. The small space necessary to accommodate them and the nature of food required, brings the cost per pound at a marketable age within a nominal figure.

Prime beef is at the present time almost a luxury, and those who reside in large cities and buy cheap steaks do not always get what they want, and are liable to get a horse on their hands, or, at least, a part of one. Banish the thought, but the fact remains that such things do occur and that, too, much on account of the scarcity of beef and the high price of prime steak. Conditions are continually changing, and as the supply of certain products becomes limited, the price goes skyward and beyond the reach of many.

Belgians, New Zealands and Flemish rabbits can be raised to three months of age properly and sufficiently fed, not to exceed 10 cents per pound, actual cost, and as the meat will bring from 20 to 30 cents per pound dressed, it can be readily seen that the balance is on the right side.

Belgians.

The Belgian hare is pre-eminently the animal for the fancier as well as for the practical market breeder. Because of its general food qualities, it possesses the unique distinction of being acceptable to the fancier and to the farmer alike. This then is the guarantee of its permanence; for without a substantial, practical foundation, any fancy, however fascinating, would soon have had its day.

A full grown Belgian hare weighs from eight to twelve pounds. Their meat is juicy and tender, making them fine for the table. They are very prolific, commencing to breed when only 6 months old, producing their young four to five times a year and from five to twelve at a time. They require but little attention and thrive well in small quarters.

New Zealand Hares.

This valuable breed was imported to this state about six years ago from New Zealand, and they are fast displacing the Belgians for both fancy and market purposes. They are not quarrelsome like the Belgians, therefore large numbers may be kept together with little danger of them fighting. Their strong points compared with the Belgians are: They will reach market size in less time. The meat is white and more acceptable to the fancy trade and last, but not least, they are always in good market condition. They are good breeders and attentive mothers. In color they are a reddish buff.

Flemish Giants.

They were introduced to this country about the time of the fatal Belgian hare boom and suffered with that and other breeds when the crash came.

They have recovered, however, very rapidly and are of the foremost varieties in popularity today, with great probability of becoming the leader.

The standard weight, that is, the weight considered by leaders of the fancy to be fairly large, is 11 pounds for bucks and 13 pounds for does, and most specimens come up to that requirement when in condition.

The Black Flemish are just as pure as their gray brothers.

In order to obtain the black ticking without which the Gray Flemish coat lacks in fine appearance, it was necessary to introduce black blood.

In all particulars, excepting color, they should compare with the Standard Flemish. This breed is destined to become one of the most valuable for several reasons.

The herd will look much more uniform, which is always a point to be desired, the same as in all other stock. The pelt is more valuable than that of any other breed of rabbits.

Black bucks mated to does lacking tone and color, infuse new vigor in their offspring, always being strong and hardy.

STATE FEDERATION OF POULTRY ASSOCIATIONS.

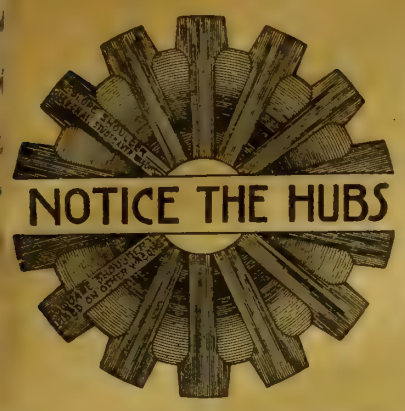
During the recent Santa Cruz Poultry Show delegates from various associations over the state gathered and took further steps looking toward preparing for the "greatest poultry show in the history of the world." This is to be held in connection with the 1915 Exposition at San Francisco. The idea is to go into the matter of the poultry end of the show and bring the attention of the management of the great fair to the importance of giving poultry its just position. The pressure brought upon the directors to make every feature of the fair supreme will be such that certain of the less spectacular features may be sidetracked with small attention. This organization of poultry lovers will endeavor to secure a just proportion of the funds and to make this, as noted, the very greatest poultry show in the history of the world.

Mr. Gibson of Oakland was the presiding officer and the delegates were welcomed to the city of Santa Cruz by its mayor. J. T. Brooks of San Jose, first temporary secretary elected at the San Jose meeting, found himself unable to serve and Mr. W. H. Bissel of Livermore was elected to fill the office in the temporary organization. Mr. L. C. Byce of Petaluma Incubator Company was elected delegate to attend the American Poultry Association meeting held in Denver next week. He is to present the matter before the association and secure its co-operation in the campaign which will lead up to the great show.

Of course when such a body of poultry enthusiasts get together, general poultry matters, even to the cost of production, are sure to be discussed, but in the main the entire meeting was devoted to the one great question of perfecting a great state organization which should aid in every way possible the covering of this great exposition. A committee was appointed to aid in forming the state organization, the committee consisting of: E. R. Evert, San Jose; E. L. Andrews, Watsonville; Henry Berrar, San Jose; Dr. G. I. Royce, Los Angeles; Wm. W. Hirsch, Irvington. Messrs. Gibson and Cobbledick of Oakland were appointed a committee to co-operate with the live stock commissioner whom Governor Johnson appoints for the 1915 Exposition.

The next meeting will be held in Los Angeles January 6, 1912, at which time the organization is expected to be perfected and several forward steps taken.

As the chicks get larger, they should be provided with larger coops, otherwise their bodies are liable to be deformed from crowding one another too much.



On the next *Studebaker* Wagon you pass on the road

Why aren't they split and cracked like the ordinary wagon?

Because the ordinary wagon hub is made from oak, a wood that splits and cracks very easily, while

Studebaker WAGON

hubs are made from *Eastern black birch*, a very springy, tough wood, chemically treated, with great weather resisting qualities.

Western birch is used by some manufacturers, but it is even poorer than oak. It is *brashy* and will not stand the strain.

Studebaker hubs cost more than any other hub on the market, but they are stronger and wear longer.

Another reason why you should buy a *Studebaker* from

Mildew on Grapes.

Is it judicious to feed mildewed grapes to your chickens, if thoroughly washed, as a ration of green food at noon?—Subscriber, San Gabriel.

It is not "judicious" to put it mildly. Mildew is a fungoid poison and it would be difficult to wash the grapes sufficiently to eliminate all the poison. Hundreds of chickens and mature fowls died at one time in Los Angeles from eating mouldy meat. Chickens are usually very fond of grapes and would be very apt to eat a considerable amount of the mildew and I would consider it highly "injudicious" to feed the grapes even when washed. —Mrs. A. B.

Prolapsus of the Oviduct.

Some of my year-old White Leghorn hens I noticed bleeding at the vent and all the other hens in the pen trying to eat them up. They did sever about six feet of the intestines of one hen before I could get to her. They protrude at the vent, strain a good deal. All are laying hens. If I can get the hen away from the others before they injure her too much she gets well by applying a little castor oil to the affected part. I feed wheat, barley, corn and wheat meal and bran, and they have all the chopped green alfalfa they want twice a day and dripping water all the time. I also have some 8-months-old Barred Rocks that go down on their legs, sit down and drag around when they move. One has been down that way for a month. They don't have much use of their legs. It seems like rheumatism. I would be very thankful if you could give me a remedy for these troubles. —Mrs. J. A. C.

Your hens have, I think, prolapsus of the oviduct. Dr. Salmon says: "It is frequently observed in hens which have been great layers. Overfeeding, too stimulating food, constipation and straining to expel large eggs are the direct causes. It may also occur from any condition (such as too much fat) which prevents the passage of the egg." As soon as symptoms are seen catch the bird and examine it carefully to determine if an egg has been arrested in the passage. If there are no signs of the presence of an egg, apply carbolated oil or lard and return the part by gentle pressure. Keep the bird in a small coop where it will be quiet until it has recovered." I would add that I think you are giving rather too much heating food and would advise you to give a little Epsom salts in the drinking water for at least a week to all the flock, a level teaspoonful in a quart of the drinking water.

The 8-months-old Barred Rocks have not had enough exercise to keep them vigorous. If growing chickens get their food too easily without exercise the legs become weak, the chicken gets too fat and the liver does not work as it should, then the chick gets rheumatism or indigestion and will even if cured never make a really good layer, so I advise you to eat them before they get sick, but if you want to keep them make them scratch for every grain they eat and give them all the green alfalfa that you can make them eat by cutting down the grain and also give them the Epsom salts, unless you want to eat them soon.—Mrs. A. B.

Temperature for Loquats.

What degree of cold will the loquat

This Interests Every Orange Grower

How often have you envied your brother irrigator growing alfalfa, with his simple efficient centrifugal pump, and compared it with the heavy deep well pumping plant you operate.

This is made

Spraying

NOTICE: To People Who Spray—or Ought To

The Bean Spray Pump Co. are celebrating the twenty-fifth anniversary of their organization by making the most important single invention ever added to a spraying outfit. It wonderfully increases the value of their new sprayers and can be fitted to old outfits.

On the quarter century anniversary they have also made the power sprayers much more complete than ever before and then reduced all prices lower than ever.

You are cordially invited to see these new outfits. They will be exhibited so far as possible in every locality where two or more parties are interested. The itinerary is now being planned and a prompt reply on whichever blank below fits your case will make it possible to let them show you what they have.

stand and bear fruit?—Subscriber, Riverdale.

It will depend upon the time of the cold weather, but as the tree blossoms during November and December when cold weather is more likely to come, we should say the temperature should not fall below 28 to 30 degrees. Yet we know trees in sections where the temperature has fallen to 20 and they still have occasional good crops of fruit. After the tree attains a few years growth, it has been known to stand as low as 15, but we do not think such conditions would induce regular bearing.

Hogs Eating Chickens.

What will keep hogs from eating chickens? Can anything be fed to them which will stop the habit?—Subscriber, Wasco.

Once the habit has been formed we do not think it can be corrected. Supplying blood meal in the ration or bone flour might prevent the craving, but we assume the habit, like the egg-eating habit of poultry, once formed, will remain.

Yellow Leaf.

What is the trouble with the enclosed lemon leaves? They turn yellow and sometimes drop off. Some are also covered with smut and honey dew. They have had some silver mite and red spider. Work is shown on the fruit by the silvering of the lemons and russeting of the oranges. Have recently sprayed with .03 solution of lime-sulphur. Have seen none of their work since spraying. — Subscriber, Lakeside.

The yellowing of these leaves is due, doubtless, to chlorosis which is a little understood disease. To give an outline of the various treatments recommended would require several columns. Presumably it is a physical trouble and the bringing of the trees to good condition through fertilizing and improving mechanical conditions of the soil and ridding trees of pests, will aid in this. The amount of smut over the leaves would indicate black scale or an abundance of aphis which is causing the honey dew which gives the soil for growth of the ordinary black fungus. We think your treatment of spraying with sulphur-lime solution is the best for red spider.

Fall Strawberries.

How should I treat strawberries set in October so as to secure a crop next summer? Should they be planted on ridges or on the level, and how far apart? What variety is best for this locality?—Subscriber, Fresno.

We refer our inquirer to the Vegetable Garden page of this issue, where this question is treated by Mr. Lobingier.

To Secure Humus.

I have been planning to sow peas this fall in our fifteen year old apricot and peach orchard to plow under for green manure. Would this be wise when I have no water to depend on except winter rains; would it be better to use stable manure for humus? Which is best to use, high-grade bone meal at $38.00 a ton or Mococo superphosphate at $27.00 per ton?—H. S. F., Lakeside.

Without question the application of stable manure will give you a supply of humus quicker than any other method, especially where you have to depend upon the rains you are liable to get a very light crop of peas. If the rains should come late, then the growth would not start until the colder part of the season and you would get very light tonnage. Where irrigation is possible and the planting is done in September, the peas or vetch get fully rooted before the cold season comes and a reasonably good covering is made. The trouble with stable manure is, as a rule, its great cost and often absolute inability to secure it. Without knowing the percentage of phosphoric acid in your bone meal and superphosphate, it would be impossible to give you values. We believe that other things being equal, we would prefer the bone meal, though it might show a lower percentage of available phosphate than does the superphosphate.

Egyptian Corn and Sorghum Poisonous.

Is there a time when, and what is the state in which, fodder of milo maize and Egyptian corn are poisonous to cattle?—Subscriber, Hemet.

Sorghum has been known to poison cattle. It is claimed that under certain conditions of drouth and lack of irrigation that prussic acid is formed and stock have been known to die from eating it. We have never known of a case in California, and Mrs. Sherman has repeatedly written in her articles favorably to use of these fodders. If we were growing these plants for fodder we would be careful to keep plants growing. In such case, we do not know of any danger.

Belgian Hares.

Can you give information regarding the raising of Belgian hares for market? What is the best kind of food and what is the market?—Subscriber, Greenfield.

We refer our subscriber to article by Mr. Caldwell on poultry page of this issue.

Morning Glory.

Please advise me through the columns of your Cultivator of a method of ridding a lemon grove of wild morning glory. I have five or six trees with this plant growing under them. I am each week digging them up as best I can and collecting stems and roots and burning them, but being new to this section I thought advice from you might help me.—F. M. G., Orange.

Your method of work is probably as good as can be followed. There has always been a desire for a royal road for killing out this miserable pest. In the open field where there is no other plant to be injured, covering of the ground with two or three pounds of salt to the square foot will accomplish eradication of bindweed, but of course in an orchard this would result also in the destruction of trees. In taking it out at cultivating time, be careful not to carry any bit of the weed to other sections. It should be cut as fast as it appears through the surface, in fact, should not be allowed to appear above the surface. It can be killed by thorough cultivation and the dread of it should be sufficient to induce its complete eradication.

Measuring Water.

Can you give me a table for measuring water coming through a weir so I can get the number of miner's inches? A board four inches wide is used which gives us a four-inch pressure. The top of the board is on a level with the top of the water and the water is measured that flows between the board and the bottom of the weir.—Subscriber, San Fernando.

We believe our subscriber has a confusion of ideas regarding weir and measuring box. The making of a weir, together with table for calculating number of cubic feet per second was given in the issue of the Cultivator of March 31, 1910, also March 30, 1911. This is too extended to reprint at this time. This weir it must be borne in mind must be made very accurately and perfectly level. Then the table given will enable you to get fairly accurate results. The measuring box is a different thing and perhaps for the novice more accurate, if carefully made. The subscriber is not entirely right in his suggestion that the board above the weir should be four inches wide, though it may be wider, but to secure a four-inch pressure the water should stand four inches above the center of the one inch opening. The properly made measuring box has the opening or slot

exactly one inch wide. In this is a sliding stop which is worked back and forth according to the amount of water until it raises the water beyond the front of the box, as noted, four inches above its center. Then by measuring the length of this opening through which the water flows, the exact number of inches is secured. This box is described in the Cultivator of May 6th, 1909. To reduce cubic feet per second to miner's inches, multiply by 50, that is, under the laws of California a cubic foot per second equals 50 miner's inches, as it does in Idaho, Nevada and Utah; in Arizona and Montana, 40 inches, while in Colorado it is only 38.4.

IRRIGATION POINTS.

By W. Wilson, Los Angeles.

Will you allow me to use as a text the following extract from an editorial on irrigation in your issue of 6th inst?

"Light sprinkling has ruined many crops because of spraying over the foliage in the heat of the day, and in addition not soaking the ground to the depth one often thinks. Furrow irrigation is the best where it can be followed, and for this reason garden planted in rows will be easier to handle. When irrigating, let the soaking be thorough, and the cultivation equally as thorough after the soil is in good condition."

Before I became a reader of The Cultivator I used the surface method of irrigation in my garden, with the result, in warm weather, of losing many plantings. The seeds did not sprout, or, if the plants did appear, they were sickly and did not do well. Later, thanks to you, I adopted another plan, which I will describe, as it may be of benefit to others. I make as deep a furrow as I can with a large hoe, and soak the ground thoroughly with a small stream of water flowing slowly the length of the furrow. I then wait two days or more, cultivating thoroughly just before the soil gets dry enough to cake. Before I cultivate I carefully rake back from each side of the furrow all the dry soil on top. Then I plant my seed, and I never have a failure. Another very good plan is to plant the seed in the dry soil and make a furrow about six inches to the side of the row and let the water run as above until it soaks over to the seed row, and then cultivate, taking care not to disturb the seeds.

I am writing this because I have seen so many failures from irrigating on the flat surface of the soil.

* * *

Mr. Wilson surely has the right idea in irrigation. In fact, we have seen orchardists who go a step farther than he has in the matter of early cultivation after irrigation. Instead of wating two days as he suggests, or "just before soil gets dry enough to cake," the method in question calls for exceptionally deep furrows and far enough apart so that there is dry soil between. After very thorough irrigation the water is allowed barely time to seep away when a plank smoother or light cultivator is drawn over the dust ridges, forcing the dirt into the furrows. Then two or three days later the narrow tooth cultivator gives a very deep cultivation, followed by a light cultivating or harrowing later. It must be borne in mind that the two days following irrigation and before cultivation permits the loss of a quantity of valuable moisture. This method saves a large part of that.

TREES

Orange, Lemon and Grape Fruit Trees, all first class stock. Special prices to parties planting groves. Fresh avocado seeds for August delivery, $3.75 per 100. Also strong Florida sour seed bed stock. Edward A. Carvel, 1454 Oak St., Glendale, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

Fine line of Navels—Valencias and **Eureka lemons for delivery spring of 1911. Contract now and get the first choice. The King Citrus Nurseries, Whittier, Cal.**

For Sale—500 Choice Valencia Orange Trees and some Washington Navels. G. W. Thurston, R. F. D. 6, Box 82, Los Angeles, Cal.

Imperial Valley Fruit Ranch to Let—160 acres in early table grapes, apricots, alfalfa and cotton; 2 miles from county seat. Tenant must have experience, and $3000 capital to furnish labor. Address Horticultural Dept., Box 2, El Centro, Cal.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

LIVE STOCK

STALLION FOR SALE.
The Imported Percheron Stallion
SANSONNET.
Color gray. Foaled March 1, 1905.
SANSONNET was considered by Mr. Charles Aveline, President of the Percheron Society in France, to be the best two-year-old that he ever raised With immense size, heavy bone, short legs and enormous width, Sansonnet possesses in the highest degree all the qualities most sought for in a perfect draft horse. It is not often that such an extraordinary individual is permitted to leave his native country, and the breeders of America are very fortunate in securing the services of a horse that any breeder in France would be proud to place at the head of his stud of pure-bred mares.
SANSONNET was entered in the Colt class and open class at the International Live Stock Show, Kansas City, Mo., in 1906, and took the blue ribbon in both classes. Weight 2,000 pounds. Sure foal getter and splendid disposition.
Terms to responsible parties. Apply to Wm. M. Way, Secretary Farmers Percheron Horse Association, R. F. D. No. 5, Modesto, Cal

Stallions for Sale—Acclimated animals. All harness broken, sound and gentle. Leader 40637. Dapple gray, 8 yrs. old. Ladoga Leon, 66619, 2 years old. Dark gray. Dam weighs a ton. Liberty 74310. Black yearling. These three are registered in the Percheron Society of America. Atwood, bay carriage stallion, 2 yrs. old. Solid color. Sired by Athadon, 1st dam by Junio, son of Electioneer. McKinney Don, 2 yrs. old. Solid bay with black points. Sire Stanford McKinney. 1st dam Belladonna, standard by trotting record. 2nd dam by Athaneer. Both well broken to buggy. Minnewawa Stock Farm, Fresno, Cal.

For Sale—Imported coach stallion, Registered No. 4113. In his prime, sound, kind and stylish. Guaranteed. Colts of the finest type to show. Dr. Fred G. Matthews, 1232 Central Ave., Los Angeles. Both phones.

Grapewild Farm Herd of thoroughbred Berkshires. State fair prize winners. Boars and sows of all ages, unrelated. Address A. B. Humphrey, Mayhews, Sacramento Co., Cal.

Three Holstein Friesian Bulls, splendid young animals, for sale. Well marked and subject to registry. Write at once to Geo. C. Roeding, Fresno, Cal.

For Sale—Shorthorn bulls and Berkshire hogs. Bred for size and quality. H. L. Murphy, Perkins, Cal.

Berkshire Pigs for sale from registered stock. B. de Groot, Aptos, Cal.

WANTED

Local Representative Wanted. Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. The National Co-Operative Real Estate Company, L 448 Marden Building, Washington, D. C.

Manager of Orange Property—Have had wide experience in handling orchards and alfalfa. Wish position as manager or in directing labor. Specially wide experience with the citrus. Address Y, Cultivator Office.

Wanted—I want to buy an ensilage cutter with blower or elevator. Must be in good condition or easily repaired. Address F. F. Wiltse, Modesto, Cal. R. F. D. 1, Box 76.

Wanted—Practical, experienced alfalfa man desires to lease a fully equipped alfalfa ranch on share basis for a term of years. Will guarantee results. Best of references. Address, O. K. Clardy, Little Rock, Cal.

DAIRY SUPPLIES

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want, and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

GUY F. KELSEY CO.
Full line of dairy supplies. Come in, phone or write. Generous sample of Prosperity Washing Powder given on request. 106 East Eighth St., Los Angeles, Cal. Phone Main 7496.

Dairy Floating Thermometers and all kinds of supplies for the dairy at Guy F. Kelsey Co., 108 E. 8th St., Los Angeles. Phone Sunset Main 7406.

Agricultural Implements—Vehicles

For Sale—Agricultural implements, vehicles. Splendid values, lowest prices, liberal credit. See us without fail before buying. Catalogs mailed out of town customers. Write us describing what you wish to buy. When in the city a personal call will show the largest stock and assortment in the Southwest. Arnott & Company. Established 1892. 112-118 South Los Angeles Street, Los Angeles.

MISCELLANEOUS

Free—"Investing for Profit" Magazine. Send me your name and I will mail you this magazine absolutely free. Before you invest a dollar anywhere get this magazine—it is worth $10 a copy to any man who intends to invest $5 or more per month. Tells how $1,000 can grow to $22,000; how to judge different classes of investments, the real power of your money. This magazine for six months free if you write today. H. L. Barber, Publisher, R. 430, 28 W. Jackson Boulevard, Chicago, Ill.

For Sale—1 length 6-inch standard at 28c; 1 length 5-inch, 22c; 1 length 4-inch, 16c; 2 lengths 3½-inch, 14c; 21 lengths 1½-inch, 4c; 14 lengths 6 5-8-inch S. D. casing, 25c; 34 lengths 4½-inch, 13c. Also one 4-inch and two 3¾-inch 20th Century Air Lifts. Address H. E. Carse, Consulting Engineer, 222 Security Bldg., Los Angeles, Cal.

POULTRY SPECIALITIES.

Special Incubator Offer—We are overstocked on 130-egg size Success Incubators. We offer 50 of them at $10 each as long as they last; regular price $14. Order now. E. E. McClanahan Incubator Co., 112 East 8th St., Los Angeles, Cal.

TURKEYS.

Baby Turkeys, White Holland, 2 days old, hen-hatched, bright and sturdy, 35c. 3 for $1. Will sacrifice on account of absence from home. Rare chance to start with Hollands. Mrs. Hocking, Guasti, Cal.

POULTRY

1889-1911—Barred Plymouth Rocks, Ocean Blue Strain. Birds of our breeding made a phenomenal record in the hands of our customers this season. Won first place at five of the largest Coast shows, besides many shape and color specials. Fourteen silver loving cups were won by this strain. We won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pen for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—$3 and $5. Mr. and Mrs. D. T. Wieland, Moneta, Cal. Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

Lasher's Hatchery, 15 Kent St., Petaluma, Cal.—Why my chicks live and grow in the hands of my customers: They are all hatched from free range stock, bred right, mated right, fed right. I have the most up-to-date hatchery building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks; 16 years in the hatching business, 10 years at present stand. It is no experiment or guesswork with me. Am now booking orders for August and later delivery. On account of time and room, will sell all of my Belgian Hares, 200 breeders, young and old. Write for prices on just what you want.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Our Red chicks are hatching strong, only $12 per 100. Do you want Ancona chicks at $15 per 100 or 18c each? How about yearling males at $3 for Leghorns and Anconas; $5 to $7 for R. I. Reds and Buff Orpingtons? Eighteen Leghorn hens and cock for $20; R. I. Red young cock and four hens, $12; Buff Orpington young cock and four hens, $14. Write for our summer price list. Goodacre Bros., Compton, Cal.

S. C. White Leghorn Cockerels, 3 months old, from roosters of F. Baldwin, San Jose, and one of the best flocks of White Leghorn hens in Petaluma. If taken before Sept. 1, $1.50 each or $12 per dozen; after Sept. 1, $2 each or $18 per dozen. Also Buff Orpington cockerels, $1 each. L. T. Smith, Beaumont, Cal.

Standard Poultry Yards have the thoroughbred Crystal White Orpington Eggs for hatching, in incubator lots or single settings (from the Cook or Kellerstrass strain). Baby chicks from the same strain from one day to one month old for sale. Prices quoted upon application. E. C. Worden & Son, Props., 4004 University Blvd., San Diego, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Place your order for fall cockerels. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Day-Old Chicks, Barred Rock and White Leghorns, good laying strain. Order now to insure early fall delivery. The Fairmount Hatchery, 29 B Rural No. 1, Santa Cruz, Cal.

Rose Comb R. I. Reds—Eggs one-half price balance of season. A few breeders for sale. Young stock later. Mating list on request. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Orpingtons—High class Buff and White. Bred to lay from prize winning stock. 500 pullets and cockerels for sale. Reasonable prices. Will mate pens with unrelated males. Write Mrs. S. Swaysgood, Route 1, Healdsburg, Cal.

White Leghorns—Buff Orpingtons. Bred for beauty and great egg production. Grand lot of both old and young stock for sale. Prices reasonable. Write your wants. Model Poultry Farm, Box H, Irvington, Cal.

Hicks Jubilee Hatchery, now booking orders. Write us your wants. We use eggs from first-class stock only. Try us. W. J. Hicks, Petaluma, Cal.

The Luedkes—Incomparable R. I. Red, high record layers—now booking orders for eggs for fall delivery. P. O., Anaheim, Cal., Route 1.

Rose Comb Black Minorcas, nine years line bred. Stock and eggs in season. Eleanore Minorca Farm, R. D. 1, Los Angeles, Cal.

Good Barred Rock Cockerels, $1 and up, according to age and quality. G. L. Hawley, Madera, Cal.

For Sale—One pair year old guinea fowls. C. G. Wetherville, 3009 Eagle St., Los Angeles. Home phone 41482.

DUCKS

For Sale—Mammoth Pekin Duck Eggs, 75c per 12; $5 per 100. Special offer in breeders to make room for young stock; $4 per trio; pens of 6 or more, $1 each for ducks, $1.50 for drakes. A. E. Nelson, El Monte, Cal.

A Few Choice English Indian Runner Drakes for sale, $2.50 each. Orders booked for eggs from same strain, $1.50 per dozen. Unsurpassed layers, white eggs. Address Mrs. Fred Chester, Santa Rosa, Cal. Route 2.

Limited Number of Mammoth Pekin and Indian Runner Drakes for sale. Also a limited number of trios. My stock is of the finest non-related. Mrs. Benja. G. Johnson Box 10, R. D. 1, Vacaville, Cal.

Splendid Mammoth Pekin Breeding Ducks $1 drakes $1.50, trios $3 Mrs. Guerard, Merced, Cal.

---The Largest, and Lowest-Priced Furniture House in Western America

Our immense store—more than 215,000 square feet of floor space (just increased by the addition of another great eight-story building, half as big as our main building), together with our mammoth warehouses—in all more than 500,000 square feet of floor space—contain the largest stock of furniture, carpets, Oriental and domestic rugs, draperies, wall papers, upholsteries, mattresses and bedding, linens, stoves and household wares, china, glassware, etc., etc., in the United States.

HER LAST POEM.

A melancholy interest attaches to the following poem, which was the last written by Elizabeth Stuart Phelps, who died a few weeks ago.

The Twain of Her.

Now the Martha of her stiffened to her
Down-weighing, of relentless daily care.
Now she straightened upright, would not bend nor break,
But held herself all iron standing there.

When the Mary of her called unto her soul,
And made a moan, and cried to it in vain:—
"Oh, this woman—look! She fretteth overmuch,
And leaves no space for me, Lord, I complain."

But the Martha of her listened with the sigh
Of those too weary or too strong to rest:—
"Tell who taketh then this burden if I cease,
And empty both my hands upon my breast."

Oh, a soul divided is a soul forespent,
She went still asking: "Is it I? Or I?"
Low forever through the silence Mary spoke,
And Martha, sad and sure, did make reply.

Till the irony and harmony of death
Made out of these a concord high and sweet.
When the Martha of the woman, toiling, passed,
Estranged from ease, she sought her Master's feet.

"Now my turn has come, my turn at last," she cried,
"My turn to worship, listening to Thy word."
—Ah, but calm beyond her, fair above her still,
The Mary of her knelt before the Lord.

—Elizabeth Stuart Phelps, in Harper's Bazar.

A PRINCE, A PRINCESS AND A BEGGAR MAID.

She sat waiting in the great surgeon's outer office, with the book of old fairy tales lying open but unheeded in her lap. Among the larger packages she carried was a small one of tissue paper that was sufficiently deceptive in shape and size to hide from the eyes of the curious the flame-colored carnations within.

She had been waiting her turn patiently for over an hour, her eyes showing the weariness of a tired spirit and a frail body. She had tried to pass the time by reading out of the old worn book of fairy tales placed in the rack by the surgeon to amuse some waiting childish sufferer. The book had rested there for years. It was among her earnest remembrances. Treatises, books of science and the favorite novels of the day had appeared and disappeared, but either by some fate or by intended chance the old fairy tales had remained. It had grown to her to be part of the office and she always connected the book with the man and place.

Patients came and went. Newcomers glanced pityingly at the girl in the corner with the book and the small tissue package and the crutch. Her neat but old dress seemed out of place with the refinement of her cameo-like features and the high-bred carriage of her head. The girl, however, did not pity herself. She could have told them how near to the culmination of her hip disease she was; how soon she was to be allowed to drop her wooden support and walk upright and alone for the first time in years. She could have told them whose skill had made the hope a living possibility. She could have told them how, when the great fortune had melted away, the surgeon had insisted that the treatments should not stop, and that was why she would now and then repay him with a flower instead of the old accustomed gold. These things she could have told them if she would, and of her lifelong friendship with him; why the old book of fairy tales and the story of the prince and the beggar maiden had a strange, new fascination for her.

She had become conscious of a faint aroma of violets filling the room of the rustle of silk skirts, and she looked up.

The woman who had entered was young, perhaps a couple of years younger than herself, she thought, with a pang realizing that she was twenty-four. And then—the other woman was beautiful. It was at this point that she had dropped the book in her lap unheeded and looked out of the window. She could see the girl's carriage waiting at the door. It was the first time she had noticed it there. Indeed, it always seemed to be there now, and yet the girl's hurt had not been so very serious—a slightly burned hand that needed dressing, she had heard the surgeon say. Almost unconsciously she hid the flower wrapped in the tissue paper underneath her other packages.

The surgeon appeared at the door. He was not an old man. He was not even middle aged. Yet he had made a great name for himself. He had probably done more for surgery in his eight-and-thirty years than many men had done in 60. He had been decorated abroad and he had been a prominent figure at home and foreign medical conventions. There was something in his quiet voice that inspired confidence, a look in his gray eyes that spoke of hope to a suffering humanity. The girl had heard that quiet voice for years, had known that look since she was a child.

The rustle of silk increased as he appeared at the door, and the younger woman with the violets arose. The girl in the corner drew a deep breath at the smile of greeting that crept around the surgeon's mouth. Their voices came faintly to her. The remarks were commonplace enough. It was the air of proprietorship about the rich girl that hurt. The young surgeon crossed the room to her.

"I know it is your turn, Kathy," he began, with the familiarity of years, "and that it is awfully mean of me to ask you to wait longer, but would you mind if I saw Miss Mason first? She is going out of town."

The girl looked up with a laugh. She was conscious that the younger woman was watching her, and her voice was quite cheery as she replied:

"Why, of course not." She nodded toward the doorway with a smile. Entering 15 minutes later she found the great bunch of violets standing on the young surgeon's table. When she laid down her packages she was careful to hide the small tissue paper one underneath, but the surgeon's quick eye saw it and his quick hand drew it forth.

"What are you trying to do with my flower?" he asked gayly.

"I never said it was for you."

"Certainly not; that would be unnecessary," and he proceeded to unfold the paper and take out the boutonniere of red carnation and geranium leaf. He laid it on the table, where it formed a striking contrast to the violets. A sharp look of pain swept across the girl's face.

"Suffering again with the old trouble, Kathy?" he asked, with a friendly kindliness not to be mistaken.

"I shouldn't wonder, John."

Years ago, when she was a child, he had allayed the pain of treatment by telling her marvelous tales, more wonderful even than those in the old fairy book; later he had amused her with descriptions of places and people he had seen and met, until she half forgot the cruel steel. Today he told her the story of the violets, haltingly, shyly, more like a boy of 12 than a man of nearly 40 years.

Half an hour later, when she returned to the outer office in search of a forgotten umbrella, she saw lying in the chair where she had sat the old worn book of fairy tales, still open at the story of the prince and the beggar maiden. With an instinct of orderliness, bred in these later years by stern necessity, she mechanically closed the book and carried it over to the rack.

"It isn't so in real life," she thought; "in real life it isn't so!" The book obstinately refused to fit into place. "It is all beautiful—in the fairy tales!"

"Love is an obsolete thing among these stupid mortals," fumed the prince in the fairy tale.

"Don't be too sure," snapped the princess, who once had been a beggar maiden.

II.

She glanced around the room of the outer office curiously. It was much the same as it had been in the past. She glanced out of the window almost expecting to see the rich girl's carriage near the curb. She almost expected to see the rich girl herself sitting near, with the mass of violets on her breast; but the room was quite deserted except for the wan and shrunken mite of a baby she bore in her arms and which she had soothed into a quiet sleep. The man at the door who had admitted her told her the surgeon had been suddenly called out on an emergency case, but would soon return, and so she was waiting for him; waiting again as she had waited as a child and a woman; waited as she had now waited for years, and not for herself this time. Still holding the baby, she crossed the room and stood at the old book rack. She was wondering if she would find the fairy tales there. She had never opened a book of fairy tales since the day she had replaced this one here, and she did not put forth her hand to touch it now.

"Life is so different," she said, half aloud. "Life holds nothing as beautiful as this. Life is so real and —hard!"

She turned away, finding it difficult to dispel the illusion of the aroma of violets. So the rich girl—the girl of the silk and the violets—his wife, was dead. It was hard to realize that; almost as hard as it had been to grow accustomed to the idea that he was married. She had gone to the wedding, and in the months that followed, her eyes, grown wonderfully far-seeing, divined the shadows that one by one crept into his. He had never hinted to even her, well as he had always known her, that everything was not as he had hoped it would be; that his marriage had left much to be desired and his heart unsatisfied. He was far too loyal for that. But, instinctively, she knew, and her heart ceased aching for herself and only ached for him. Then the work of years had been fulfilled. The cure had come and the crutch had been dropped forever. His task was finished and her visits ceased. For five years she had been away—teaching. She had never ceased to follow his career with interest. Then had come the tidings of his wife's death two months after she returned to the city. Now, counting on the long friendship and by the love of his life service to sufferers, she was waiting for him again.

An hour later, when he entered, she was still alone. She was holding the sleeping baby carefully in her arms and gazing fixedly toward the book rack.

She was conscious of an added quietness, a graver look in his eyes and a touch of cynicism she could not define, but felt.

"Yours?" he asked, glancing at the child she held, after greeting her.

She shook her head.

"No," she answered; "a poor baby I picked up amid my wanderings and that I could not bear to send to the dispensary. I have brought him to you to cure."

"You are as charitable as ever," he said, briefly. "A rare virtue."

"You are not the man to say that," she retorted, remembering the days when her own account had been canceled by a flower.

He laughed shortly.

"I am selfishly kind sometimes," he said, "such cases advance me in my profession. I get more than I give. I get experience."

She did not discuss the matter further, as she watched him examine the child.

"It is a pitiable case—a pitiable story. Drunken father, dying mother. If you could spare the time——" She broke off.

"We'll have the kid well in a year. See that you bring him to me twice a week. Now, tell me of yourself. The trouble has never returned? It was a cure?"

The story was soon told; told in the even, gentle, womanly voice he had known for years and which he had not heard for so long. It contrasted strangely with the impatient tones of the woman who had been his wife. He fingered a paper weight nervously.

"When I returned to the city two months ago I heard of your wife's death," she said, after a pause. It was characteristic of the woman that she did not add the accustomed conventional words of sorrow she did not feel and which she knew he did not.

"Yes," he said.

There was a long silence. Outside the far-off rumble of drays came to them, deadened by distance. The clock on the mantel ticked loudly.

"It was all a big blunder, Kathy," he said slowly.

"I guessed it—long ago," said the woman.

"I don't blame her," he went on. "I probably was a good deal at fault. But her life wasn't my life, and we never pulled together. That's all."

The woman did not answer, and after a while she left him.

"I want that baby twice a week," he said again at parting.

Twice a week the baby went to him. At first she brought it herself; then she sent him with an Irish woman whom she knew. She wrote that she did not have time to come, and the great surgeon did not question her or evince surprise. Little by little his good work grew; little by little the baby's small wasted form took on new energy and new life; little by little the small, crooked back grew straight again. Once, when the cure was almost complete, he found clasped in the baby's moist little fist a red carnation, which, the Irish woman explained, the baby meant for him.

That night he sat down and asked her to bring the baby herself next time—the last time. The following week she came.

"I wish," she said gratefully, "that I could thank you for what you have done for the baby, that I might pay you"——

"Kathy!"

"Oh, yes, I knew I would offend you," she said, smiling, "but, you see, I don't forget how long my own account is—so long that I can never cancel it. Now, the baby"——

"The baby brought me a red carnation last week," he said, irrelevantly. "I wonder how the baby knew my partiality for red carnations?"

She shook her head in swift denial and turned quickly to the deserted outer office, where he followed her. The baby was contentedly sucking his thumb on the sofa and eyeing them with a wisdom far beyond his years.

The great surgeon took the woman's hands in his. Through the old, worn gloves he felt their coldness.

"Kathy," he said gently, "how blind I was in those days! How blind I have been all my long, successful life, and yet the years have been so bitter and so barren. Kathy, if you wait"——

He bent down, looking into her eyes. The baby crawled from the sofa to the table close by and proceeded to investigate the book rack. The gay cover of the fairy tales caught his eye and he began to tear out the highly colored pictures with mathematical precision.

"I have loved you all my life," the woman was saying, simply.

* * * * * *

The prince in the fairy tale looked ruefully at his golden crown, which the surgeon's small patient had demolished.

"Strange how things come around in this world. I suppose it was the baby."

"Nothing of the kind," said the princess, who had once been a beggar maiden, superiorly. "It was simply the Universal Law."

The prince, not understanding, was silent.

Which goes to show that, under the circumstances, he was wiser than the average mortal man.—Boston Journal.

Scissors and Shears for Every Purpose
K 7-4½ IN., $1.00
K1-6 IN., $1.00
KEEN KUTTER
One of the principal reasons for the wonderful success of the Keen Kutter line of Tools and Cutlery is very careful adjustment. The blades of Keen Kutter Scissors and Shears meet from heel to point without any side pressure of the fingers. The joints remain tight even after years of use.
KEEN KUTTER
Scissors and Shears
are made for every purpose. All are guaranteed to give perfect satisfaction or money refunded without question.

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A lobe tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Hay.

Scott, Magner & Miller say:

Arrivals for the week ending today have amounted to 4880 tons. This is a sharp increase over what we have been receiving recently. The railroad companies offered cars for loading hay freely along the line, and at points where shipments had been offered. The farmers were ready to load these cars rapidly, and on Monday morning an immense amount was landed on this market. It has not been the intention of the shippers to crowd the market to this extent, but the accumulation took place on account of transportation conditions. On account of this influx the first of the week the market on the general grades might be quoted as having been a shade easier, but this condition adjusted itself toward the end of the week when daily arrivals again became normal.

There has not been much hay moving in the shipping line as the demand has been decidedly moderate, and there is being practically nothing shipped along the Coast.

Alfalfa has been arriving in moderate quantities, and has not been moving off as well as the receivers would like to see it; the summer demand is not active as yet, and only small quantities are being placed as consignments arrive. Some crops have changed hands in the river districts, but no decidedly large operations have been reported as having been brought about, and the future of the market in this line is as yet a little undecided.

The first carload of new straw arrived this morning, consigned to our firm, and while trading in this article is not active, yet the quantity that has been arriving has been decidedly light, and therefore has moved off at our quotations.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	14.50@15.00
No. 1 wheat or wheat & oat	12.50@13.50
No. 2 wheat or wheat & oat	11.00@12.00
Choice tame oat	13.00@13.50
Other tame oat	9.00@10.50
Wild oat	9.50@10.50
Stock hay	5.50@6.50
Alfalfa	9.00@10.50
Straw, bale	45@55

Grain.

Wheat	1.37½@1.47½
Barley, fancy	1.36¼
Barley, good to choice	1.32½@1.35
Oats, white	1.50@1.60
Rye	1.42½@1.47½
Mustard, brown	5½
Alfalfa seed	18
Millet	3@3½
Flaxseed	5@5½
Broom corn seed, ton	25.00@30.00

Feed Stuff.

Alfalfa meal	14.00
Bran, ton	28.50@30.00
Feed cornmeal, ton	37.00@38.00
Cracked corn	38.00@39.00
Rolled barley, ton	27.50@28.50
Rolled oats, ton	29.00@30.00
Middlings	32.50@35.00
Oil cake meal	42.00@43.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.00@31.00

Deciduous Fruit Market

SACRAMENTO, July 29, 1911.

Manager F. B. McKevitt of the California Fruit Distributors reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, July 28th, 1911:

Peaches: 157½ cars. Shipments are now increasing and will continue to do so for the next week or ten days. Early Crawfords are nearly finished. The crop proved unexpectedly light. Very few straight cars have gone forward. Elbertas are being shipped in a small way and will be in good supply from the first of the week. The bulk of the peaches from California will be moved within the next twenty days. Fruit is of fine quality and satisfactory in every respect.

Plums: 161 cars. Plum shipments continue about stationary, there being a difference of only about four cars between this week's shipment and last. They will continue in about the same supply for another week when shipments will probably decline. Diamond, Wickson, German, Sugar, with a few Kelsey, Splendor and Giant, constitute the principal varieties now offering. We have never shipped better plums than are now being forwarded.

Pears: 237¾ cars. This week's output is probably as large, and perhaps larger, than it will be at any other time during the season. The quality of the fruit is steadily improving and is now as good as can be expected. The greater portion is coming from the Sacramento river, but shipment has begun from Red Bluff and Suisun. The former reports a good crop, but Suisun will ship only about one-third of her usual quantity. Thrips has appeared in some sections and is denuding pear, plum and cherry trees of their leaves. It will have no effect on the crop, with the possible exception of pears.

Grapes: 40¼ cars. Early varieties of grapes are appearing in increasing quantities. The shipment from the northern part of the state is still very light, and consists almost entirely of Fontainbleau. Thompson Seedless from an early section of Tulare County have sold in a small way during the week. Considerable shipments will go forward from Fresno and Tulare County during the next seven days. After that time supplies will be ample to meet all requirements. Thompson Seedless and Malaga continue to go forward from the Imperial District, but owing to adverse weather conditions future shipments from this district are problematical. Mildew has appeared in practically every section where grapes are grown. Prompt measures were taken to prevent its spread and it is not expected that shipments will be affected to any considerable extent, probably not more than 10% at the outside.

Weather conditions north of the Tehachapi continue very favorable.

Comparative Statement of Shipments.

	—July 22d— 1910.	1911.
Cherries	250½	216¼
Apricots	289	223½
Peaches	772¾	344½
Plums	1177	626¾
Pears	950	255½
Grapes	30	18
Apples	43	....
	3513	1647½

Citrus Fruit Market

LOS ANGELES, August 2, 1911.

The exceptionally good prices which prevailed in all markets some two or three weeks ago are not so much in evidence at this time. Prices are still good, but a greater quantity of Eastern fresh fruits is taking up the attention of fruit

Cream Separators, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

dealers and the keenness of the demand has been somewhat dulled. Regular sizes and good fruit are still commanding satisfactory prices, however. The large number of off small sizes accounts for some of the lower quoted prices in the auctions. Shipments from this end are being reduced somewhat and fairly good prices are promised to the end of the season.

Some sales of lemons are made at as high a figure as $4.25 f. o. b. Eastern points, but the general condition of the market is decidedly weak. There is an immense quantity of foreigns in market and afloat. Fortunately California stock is green and in best condition for storing, so that shipments are materially lessening. Given a good hot spell over the East again and the market would be almost instantly cleared, but cool weather continued, no immediate strengthening of the market can be looked forward to.

Shipments.

Shipments of oranges to date since November 1st, 1910: 34,499 cars, lemons 5,819, total 40,318. To same date last season: Oranges 22,640 cars, lemons 3,973, total 27,613.

NEW YORK, Aug. 1.—Eleven cars Valencias, two cars lemons sold; market easier on oranges, unchanged on lemons. Fair and warm.

Cheapest in price, most economical to use; a child can run it. Send today for circular—it tells all about this wonderful ENGINE. Can be used for any purpose for which power is needed. Will run either right or left handed, and will run at any speed at which you set it. Two-cycle type. Send today for circular. This engine is years in advance of any other.

The Simple Gas Engine Co.

114 East 8th Street - Los Angeles, California

The La Verne Rotary Cultivator

The principle of Rotary Cultivation is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool works so close to the ground, with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil tend to keep them sharp and one set usually lasts a season. We guarantee satisfaction in regard to work and quality of construction.

Rustic Footbridge in Redwood Park

The above scene is in the California Redwood Park in Santa Cruz County and is used by courtesy of State Forester Homans, who is in charge of that magnificent grove of trees. Regarding this great heritage of the state, Dr. David Star Jordan has said:

"California Redwood Park is a leaf from the greatest of virgin forests, a sample of the redwoods as they have been for ten thousand years, and one which may be preserved for all times. Besides this, it is a botanical garden where the wax myrtle, the California nutmeg-tree, the California whortleberry, the clintonia, the oxalis, and all the other plants which follow the redwoods may be likewise saved for our descendants."

Not as noted by any means, but perhaps meaning more to the financial welfare of the state, are other forests in San Bernardino County which have been swept out of existence by forests fires raging for over ten days. The direct timber loss is not to be considered in this instance with the loss which will be visited upon orange and lemon groves of the valleys below which depend upon the waters of these hillsides.

ONE CROP ONLY!

"UNCLE SAM"

Has 320 acres for you in Utah under the "Dry Farming Act." If you have a "homestead right," I can help you to get 320 acres which will cost you only $500.00; and which should readily sell for $6,400.00, when title is acquired, viz., in five years, AND WITH NO FURTHER EXPENSE TO YOU. Can you equal such a proposition as that? The land is a fine decomposed granite soil, holds moisture well, A 1 wheat, apple and pear land, abundance of good water close to surface, altitude 4500 feet to 5000 feet, therefore exceptionally healthy. You must go and file on said land having two witnesses; residence not required thereafter. Transcontinental railroad close. Rainfall every month in the year, hence crop failure unknown. The Government Statistics show that Utah stands second in the United States on wheat production per acre, (and the altitude assures the best prices); second on oats, second on potatoes, second on alfalfa, first on alfalfa seed, first on sugar beets, first on barley. The average crop of wheat for the period of five years was 27.10 bushels per acre. Cedar fence posts can be had very reasonably.

The locator leases his 320 acres to me for five years. I guarantee to comply with all the requirements of the Government and do better still, by turning his land back to him all under cultivation WITHOUT FURTHER COST.

For full particulars write or come in and let us tell you about it and help you to it.

California Cultivator

Vol. XXXVII. No. 6. LOS ANGELES: THURSDAY, AUGUST 10, 1911 One Dollar the Year

The California Fruit Industry is Threatened

Every producer should be vitally concerned over the present attack on the California lemon industry. An exchange has well stated: "The proposed reduction in the tariff on foreign lemons. if accomplished, means the wiping out of the duty on all American fruit and nut products which are now protected by tariff.

"If it is logical to remove the duty on lemons, then the duty on oranges may be taken off. The removal of the duty on citrus fruits means loss, not only to the growers in California, but also to the growers in Louisiana, Florida and the South. If there is any good reason for the removal of the present tariff on citrus fruits, the same argument will apply to foreign walnuts, almonds and other nuts. It would also apply to foreign prunes, raisins and dried fruit.

"The whole Pacific Coast is interested in the retention of the duty on the foreign fruits and nut products. Texas is largely interested in the production of pecan nuts. A reduction in the duty on foreign nuts means disaster for the pecan growers of Texas. A reduction in the duty on foreign lemons means, eventually, a reduction in the duty on foreign oranges. This would stimulate the importation of Mexican oranges, as well as Mediterranean oranges.

"Every American dealer who handles California oranges, lemons, dried fruit, prunes, raisins, nuts, etc., knows from experience that the American products are much more wholesome, much cleaner and more satisfactory to handle than the foreign products. Every American consumer is also in favor of the American fruit product, compared with the foreign product. It is a well-known fact that the sanitary conditions in the Mediterranean fruit districts are not the best.

"Every American fruit dealer and every American fruit consumer, North, South, East and West, should immediately urge upon their congressmen the retention, not only of the duty on foreign lemons, but upon all other foreign fruit products.

"Every fruit merchant in California should immediately urge upon his fruit customers throughout the East and South the importance of urging upon their congressmen to retain the present duties on foreign fruit products. This should be done by wire, as well as by letter.

"Every fruit-grower in California and in the West who has friends in the South and East should urge upon them by wire and letter to communicate with their congressmen at Washington to maintain the present tariff duties on foreign fruit products."

Do you grow lemons, do you grow oranges, or almonds, or walnuts, or chestnuts, or raisins, or prunes, or apples, or pears, or apricots, or peaches, or nectarines, or olives, or figs or general farm produce? No matter what, rally to the aid of all products by writing some or all the following an appeal to save the lemon industry:

Apple Seedlings in the Northwest

An Address by A. W. McDonald Before the Pacific Coast Nurserymen's Convention at San Jose

In 1903 I located at Toppenish in the nursery business with the intention of making the propagating of apple seedlings a part of my business. The first three years were a failure, the fourth year I had a very good stand and grew some very fine seedlings, the fifth and sixth years were again failures, the seventh year I was almost ready to give up, but was persuaded to try again and planted one bushel of seed and got 130,000 seedlings out of the bushel. I then tried twenty bushels this last season and got 2,000,000 seedlings, or 100,000 per bushel, all very fine seedlings. This year I have planted ninety bushels of seed and will get about four and a half million seedlings.

The Northwest is coming to the front as a nursery center, more especially in the propagation of apple and pear trees, and the trees that give the best result in the Northwest section east of the Cascade range are the one-year grafts. I have found the winter season all too short for the putting up of my graft plant, and when buying my seedlings in the Middle West they never got through in time for me to start my grafting as early as I wished, with the result that I was always late in spring in getting out in the field to plant, and have had heavy losses in consequence. This reason, more than any other, has kept me experimenting with seedling growing in the West.

Another bad feature of seedlings from the Middle West is the wooly aphis. The seedling has been grown in the same location in Kansas and Missouri so long that it is impossible to get a block of seedlings there without aphis, while our ground on the Yakima Indian reservation is practically free from them, which is a very strong advantage. Then at the time seedlings can be shipped from Kansas or Missouri, we are likely to have very severe storms and stand the chance of losing our seedlings by frost in transportation, all of which conditions we are free from on the Coast or east of the Cascade Mountains, where seedlings can be grown.

As to growing seedlings west of the Rocky Mountains, we have a great many drawbacks, as east of the Cascades the wind is bad at the season of planting, which dries the ground very rapidly, and irrigating before the seed is sprouted and through the ground is almost sure to reduce the stand one-half, while if the ground gets too dry you stand a chance of having a total failure. When west of the Cascades we have the other extreme, as after the seed is planted and before it gets through the ground, rains are likely to bake the ground so the seed cannot get through.

The apple seedling when sprouting is one of the most delicate plants. It comes through the ground doubled, the seed itself coming through the ground and forming the two first leaves, hence if the ground is not very loose and fine the seed can't get through and the plant will keep growing until it breaks its neck. With all these unfavorable conditions, apple and pear seedlings can be grown in the Northwest to the advantage of the nurserymen, even when a higher price has to be paid for them than for seedlings from other locations. Their advantages over seedlings from other places are:

1. Receiving them early so that work may be begun on grafting and planting done correspondingly early. For instance, 200,000 which we shipped to the Oregon Nursery Company last fall were all trimmed and planted before the seedlings from Kansas were received. Also I loaned 50,000 to another nursery in the Yakima Valley with which to start grafting, and they had them all worked up and had to still wait on their Kansas stock, losing valuable time, which made it necessary for them to employ a larger crew in order to complete their work in season.

2. Transportation charges — which amount to about 50 cents per thousand on No. 1 seedlings in carload lots.

3. Risk of freezing en route.

4. Wooly aphis on the seedlings from the Middle West, which have cost the nurserymen heavily.

5. And last, but not least, we keep our money at home, which in itself

(Continued on Page 138.)

Citrus and Tropical Fruits

CO-OPERATION.

(Continued From Last Week.)

California Cited.

William E. Curtis, the special representative of the Chicago Record-Herald, than whom no other writer is better or more favorably known, writes from California on the subject of co-operation of citrus fruit growers, showing how that organization has made fortunes for the men who were about to give up their industry because of conditions over which they had no control as independent shippers.

Mr. Curtis says, in part: "Co-operation has been the salvation of the orange business. Until it was arranged in 1895 the industry was uncertain, and often conducted at a loss. There have been years when orange growers have been compelled to go down into their pockets to meet deficits and sell their shipments for less than freight charges. In 1892 half the oranges in Riverside County were sold for 10 cents a box, although it cost an average of more than 50 cents a box to raise them. Other years there were large profits, but nothing was certain until the organization of the California Fruit Growers Exchange, which now handles from 60 to 70 per cent of all the citrus fruits grown in the state, and does a business carrying from $20,000,000 to $25,000,000 a year. Last year the Exchange shipped out of the State of California, an average distance of 2,500 miles, 8,500,000 boxes of oranges, lemons and grapefruit, from which it collected $22,500,000. The average selling price was $3 a box. The average cost of producing and shipping was $1.70 a box, which is made up of several items—50 cents a box for growing, 35 cents for picking and packing, and 95 cents for cooling and freight. These estimates will doubtless be disputed, but they are the judgment of the best men I know."

Accomplished in Florida.

Among some of the principal achievements brought about by co-operation of the growers in Florida up to the present time, the following may be mentioned as more or less notable examples:

1. Owing to the efficiency of the Claim Department of the Florida Citrus Exchange, in properly preparing, presenting and pushing its claims for loss and damage, the transportation companies realized that they must give to the Florida citrus grower either increased efficiency in service, care and equipment, or pay the penalty therefor, and adopted the less expensive method; so much better was the service and equipment this past year that the claims rendered necessary are very much lower than ever before.

2. The realization of the necessity for care in properly handling fruit from the trees to the cars, on the part of the growers and associations themselves, has in the two years of the operation of the Exchange so awakened the growers to these important facts that, whereas at the beginning of the operation of the Florida Citrus Exchange 7 per cent decay on delivery of Florida fruit was by general consent considered "sound delivery," the total decay in all the fruit shipped by the Florida Citrus Exchange this year has amounted to an average of only 2 1-5 per cent, yet even this, as slight as it seems, means approximately 18,000 boxes of fruit delivered rotten, meaning a direct loss of $45,000 therefor, and an indirect loss to the remainder of the fruit in the cars showing decay, of probably from $100,000 to $200,000 additional—showing that, as marvelous as this development is, it can and will be still further improved.

3. A betterment in grading and packing that has been the wonder of the receiving trade all over the United States, which, in connection with the decreased decay, has awakened the citrus fruit trade to the realization that only carelessness, and not any inherent deficiency of the fruit itself, has given to the Florida orange its unearned and unenviable reputation of being a "poor carrier."

4. A much more general and decided realization of the necessity for and the use of brands, registered and copyrighted, on fruit of which the owner is not ashamed.

5. Very materially checking the many and serious evils due to the shipment of immature and unripe fruit—this covering a long range of work too extensive to even touch on in this paper, including two years' work with the Pure Food Department of the United States Government, with the boards of health in the various great cities, culminating with our own Florida state law for the prevention of selling, offering for sale, shipping or offering for shipment of immature or unripe citrus fruit.

6. From all the foregoing, results the inspiring of confidence in the mind of the trade in the value and reliability of Florida citrus fruits in general, and the Florida Citrus Exchange's brands in particular.

7. The awakening of interest and attention to the necessity for and feasibility of central packing houses, using efficient, trained, regular picking and packing crews.

8. The partial accomplishment of and the positive proof of the necessity for intelligent distribution of Florida citrus fruits to all markets of the United States in direct proportion to their necessities.

9. General and marked increase in returns to the growers of citrus fruits in Florida, not only for the members of the Florida Citrus Exchange, but for the growers of the entire state, as it is the contention and belief of the officials of the Florida Citrus Exchange that the citrus fruit growers of Florida, as a whole, have averaged at least 25 cents a box more, on the trees, for their fruit during the past two seasons than they could possibly have averaged without the efficient and arduous work of the faithful co-operative band that has helped to "hold the umbrella."

10. The demonstration to the growers of the state that the cost of handling citrus fruit from the trees to the consumer can, by general co-operation on the part of the majority of the citrus fruit producers of the state, be reduced to a point where it will be trifling in comparison to that which all of the growers had to pay before the formation of the Florida Citrus Exchange, and, alas, too many of them continue to pay unwisely, and often unknowingly.

11. The active efforts of the United States Department of Agriculture to assist us in our troubles, not only by showing us the necessity for and the

Fruit day for the El Cajon Valley in San Diego is fixed for August 19th.

methods of properly handling our fruit for shipment, but their assistance in the matter of the foreign investigation to locate the natural enemies of the whitefly and other pests, that are now being actively pursued.

12. The demonstration that the shipping season for Florida citrus fruits is not limited to the ninety days before Christmas, but that it can be, and naturally should be, a period extending from October—for the very early varieties—clear through and to June, during which entire time there can be marketed without difficulty, and at remunerative prices, 300 cars a day of properly grown, matured, graded, packed and distributed citrus fruits.

In closing, I will repeat Webster's definition of co-operation, as "operating together to one end," and state that the end to which we, as citrus fruit growers in Florida, must operate is: To obtain for an honest grower, who offers honest fruit, honestly graded and packed, an honest price for his product.

DROUTH IN FLORIDA.

The Produce News of Chicago reports: Opinions as to the size of the coming citrus crop vary widely. Reports from sections where there was a fair orange crop last year bear out the belief that the crop will be short—fully a third off from the last crop. Growers writing the Produce News, on the other hand, say the effects of the drouth will be shown in September, when they predict a heavy drop.

Based on reports coming to Tampa, Manager Temple is reported as estimating a decrease of at least 1,000,000 boxes from his early estimates, when he stated that a crop of 5,000,000 boxes was probable. This latest report revises his figures materially and he now would not be surprised at a short crop, even 3,000,000 boxes, due almost entirely to the drouth, which has been worst in the citrus growing sections of the state.

J. P. Pilkington, Jr., Florida manager for Crutchfield & Woolfolk, returned this week from a trip to South Florida. He found that the grapefruit crop will be very light all over South Florida. In Lee county there will be a light orange crop. This is in line with reports to the News for the past month. In De Soto county he found an increase in oranges, which he estimates at 20 per cent. The crop of brights will be very light all over South Florida, the great majority of the fruit running to russets. The sizes will be good, as the fruit is maturing nicely and the trees he saw were thrifty and looking fine. There was every indication of the fruit getting the size, though the color was a little backwards. There is no buying as yet and he heard little of prices being set.

From now on large handlers will be getting reports from their correspondents though there will be no estimates of the total crop given out for several weeks. As stated before, until the effects of the present drouth have fully passed estimates are but guesswork.

Another dispatch says:

Drouth is showing its effects on citrus trees. In some groves the leaves are curling up and the fruit is dropping. The shortage of water since the first of the year must be 15 inches. Groves that have been cultivated often look better, but all through the district the prospects are uneven. As a rule tangerines and grapefruit will fall considerably below normal, but oranges will hold their own. There will be a third less fruit about Crescent City than there was in 1910.

All fruit will be earlier by two weeks or more, due to the earlier blossoming. Here and there you find a rather heavy June bloom and this is expected to bring up what would otherwise be a low average. The June blossom is by no means uniform. Grapefruit trees that bore heavily last year are short at present and light bearers a year ago are much heavier now.

Spraying

NOTICE: To People Who Spray—or Ought To

The Bean Spray Pump Co. are celebrating the twenty-fifth anniversary of their organization by making the most important single invention ever added to a spraying outfit. It wonderfully increases the value of their new sprayers and can be fitted to old outfits.

On the quarter century anniversary they have also made the power sprayers much more complete than ever before and then reduced all prices lower than ever.

You are cordially invited to see these new outfits. They will be exhibited so far as possible in every locality where two or more parties are interested. The itinerary is now being planned and a prompt reply on whichever blank below fits your case will make it possible to let them show you what they have.

Deciduous Fruit Culture

QUARANTINE LAWS AND THEIR EXECUTION.

By John S. Armstrong, before Coast Nurserymen's Association.

Organized effort to be effective depends on individual effort. The United States is a collective body composed of units which work as whole in the solving of momentous questions of government; so also is this association a collective body composed of individuals, all of whom must work as a cohesive whole if work of merit is to be accomplished. And this thought brings forcibly to mind the fact that the nursery business has been a laggard in fostering its own interests. In the matter of federal, state and county quarantine legislation it has been a follower rather than a leader. We have given no attention to quarantine laws until their operation has been felt in the prosecution of our business. Not until the president of this organization gave personal attention to legislative matters during the last session of the California legislature, has there been a single instance to my knowledge where the nursery business has been represented and received consideration. The result in this instance has been on the whole favorable and satisfactory.

But it is not my purpose to dilate on local affairs, only in so far as they are of general application. The growing and handling of plants is indeed a big industry representing large aggregate capital, which in its ramifications spans the continent and also enters the sphere of international transactions. Thus we have county and state trade conditions, interstate shipments, and exports and imports. Obviously, all these cannot be regulated by mutual agreements. Intelligent county and state quarantine legislation will do much in local transactions, but interstate and international business can only be regulated by federal authority, which it seems to me, is what we must recognize and take the initiative to secure if we are to win the fight against plant diseases and injurious insects. But legislation of itself will not afford immunity—far from it. Insect life and the causes of plant disease are as much a part of vegetable life as the air we breathe and the water nurserymen sometimes drink when nothing else is in sight. But federal quarantine legislation will do much to keep out dangerous ailments of plant life and also any obnoxious insects which are as yet unknown to us. It goes without saying, that with a national quarantine we might have escaped the blight of the gypsy and brown-tailed moths, the San Jose scale, the Argentine ant, the codling moth, the cotton boll weevil, the bark disease of the chestnut trees in New York and surrounding states, besides many others that need not here be mentioned. Mr. Charle L. Marlatt, of the division of entomology, in a recent publication shows that fifty per cent of the important injurious insect pests in this country are of foreign origin and have been brought in directly on nursery and ornamental stock which might have been kept out if an efficient quarantine had been in operation, such as Austria, Germany, France, Holland, Switzerland, Turkey, etc., operate against us. The United States, however, enjoys no such protection, with the result that we have become the dumping ground for refuse stock denied elsewhere. According to Mr. Marlatt, efforts have been made to secure such protective legislation for the past fourteen years, but it has thus far been effectually blocked by a small body of nurserymen who, careless of consequences to the country at large, fear some slight check on the freedom of their operations. The value of such imported stock is said to be about $350,000 annually, while the codling moth, or apple worm, costs us sixteen millions, and the cotton boll weevil twenty-five millions a year, not to mention several other bugs adding one hundred millions more, all of them imported.

In view of these facts, I am in favor of absolute prohibition of entry of stock into the United States, excepting under the careful supervision of experts of the agricultural departments, and even then it might be limited to new or little known fruits and plants, thus stimulating the production of all stock on American soil. This would certainly remove a great danger.

Bill No. 8611 in the national house of representatives, if finally passed, is to regulate the importation and interstate transportation of nursery stock; to enable the secretary of agriculture to establish and maintain quarantine districts for plant diseases and insect pests; to permit and regulate the movement of fruit, plants and vegetables therefrom, and for other purposes. I understand that this bill is now in the hands of the committee on agriculture, which is willing and anxious to give the trade a hearing as to its provisions and operation if passed into law.

California is possibly the only state that maintains an international quarantine at San Francisco and other sea ports, which is certainly a good precautionary measure, which has done much to save us from the invasion of bugs, microbes and bacteria that cause nurserymen and growers to sit up and take notice. We also quarantine against other states, which goes against the grain of the itinerant tree peddler, but in no way alarms the intelligent nurseryman who grows his stuff on his own land to sell to his own trade.

But it is not so much the law and its quarantine provisions that bothers and impedes business; it is rather its execution, and the political appointments that give us that tired feeling for which the medical advertisements prescribe pink pills. Honest inspection by really competent authority is to be encouraged, but when it is otherwise, it becomes a menace, not only to the nursery business but to the entire range of horticulture. For it goes without saying that no one is looking for infected plants and trees—least of all the nurseryman who has his capital so invested. I will admit that the intelligent inspection of plants is fraught with difficulties requiring a thorough knowledge of economic entomology and vegetable pathology, and long experience in the field. Stock so passed on should be allowed to "go through" without unnecessary delays. How many such inspectors have you or I met? How many are there really in the field? A competent inspector is much like a good lawyer whose business is quite as much to keep people out of the law as in it; so also good inspection

service will inspire confidence and respect, and the wise nurseryman will be more apt to co-operate with the authorities than oppose them. If weak men are appointed, see to it that they are "fired" and competent ones put in their places. Don't wait to be haled into court; take the initiative in the formation of sane legislation, and see to it that the execution of the law is properly carried out. A little work in this direction will do much to expedite our business and avoid friction. Honest and competent inspection is what we should all work for.

As has already been said, uniformity of quarantine laws and the number of their execution is certainly a work this association should take up. If the laws are reasonably uniform in all the states, interstate shipments can be handled to greater advantage, and we shall all be in a position to know what is required, and how to meet conditions intelligently as well as economically. This once secured, and also a provision regulating the importation and exportation of nursery stock, the fellow with clean plants and trees has ample protection and an opportunity to get a square deal. But the other fellow with infected stock —well, he'd better clean up or get out of the game.

SEMI-CLING.

Mr. Max J. Crow of Gilroy writes regarding our statement that his new peach, which he tells us has been named the Patison and which was referred to on page 78 of the last Cultivator, is a cling. He says that when fully ripe it is what is generally known as the semi-cling, separating partially from the stone as does the Alexander, Hale and other peaches of that season.

NOTES FROM THE FIELD.

By B. R. Jones, Horticultural Inspector Los Angeles County.

It seems to me that the black scale is hatching earlier than usual this year notwithstanding the cold spring, which would be expected rather to retard it. I found a good many eggs hatched out in the vicinity of Los Angeles before July 1st and on my own trees near South Pasadena I tried the experiment of fumigating about July 6th, using a full Woglum No. 1 dose and plenty of water to make the generation rather slow. On July 17th I was unable to find any live young scale and believe I made a good kill. A little of the tender growth was burned but the trees are now starting out fine. The black scale was pretty bad on them, communicated probably from peppers growing near.

The pepper trees are a problem. All lovers of the beautiful enthuse over them so much that I fear we will never get rid of them, though they are so scaly. And it would be almost a pity to lose them, especially about the cities and towns and there they are the worst. Perhaps if we put colonies of scutellista in them each year at the right time they might keep them at least reasonably clean.

And, by the way, the scutellista larvae are just as lively after the fumigation as before. Experienced men are well aware of the hardiness of the little parasite and say it will develop all right after the scale has been killed by the gas, but the adults will be smaller than normal, which would be expected, as they have no food but spider's eggs. The scutellista is all right if he would only increase his family about ten times as fast.

I have been very much pleased at the fine fumigation work done for red and black scale in citrus groves about Glendale for the past two years. They have a good man up there and I believe one reason of his efficiency is that he measures the trees carefully and he doesn't think he is accurate enough yet. He says he will mark all his tents this year and use Woglum's system. Then he knows what he is doing. I wish every fumigator in the county would do the same. Many of them do not do nearly as good work as they should. One tree will be burned and the next one have left live scale on it after they have been over them.

The Los Angeles commissioner is thinking of requiring every fumigator who does work at the order of the office and expects its help if needed to collect his bills to mark his tents and use this schedule. Commissioner Essig is doing it in Ventura county and Wm. Wood, the new deputy from Whittier says it is the only proper way. Mr. Wood is thoroughly efficient and every one likes him. Stephen Strong takes his place as state quarantine officer at Los Angeles and San Pedro, so that very important work will be properly attended to.

FINE APRICOT.

We have received from Mr. N. P. Nielsen, an orchardist at Hayward, Alameda County, apricots of value. They are exceptionally large and the judgment of two experts is that they are the Blenheim, but we note that Mr. Nielsen says this fruit was grown on a tree which was formerly a Moorpark and was budded over to this variety. He wishes to purchase other trees of the same kind and hence desires the name of this fruit. But while we say the fruit is probably the Blenheim, the safest procedure is to have another tree grafted from this same fruit, which Mr. Nielsen says has done exceptionally well in Alameda County. It must be borne in mind that while this particular Blenheim has done well there, another raised from a somewhat different strain, may not meet the conditions in Mr. Nielsen's orchard as does this one. The rebudding of other old trees or waiting a year longer and securing seedlings and budding the nursery stock from scions or buds from this tree, would appear to promise results to justify the longer waiting. We grant that possibly the budding of this fruit on the Moorpark may have had some influence upon size and color, but it is magnificent and worth the effort of propagation.

PICKED UP IN THE ORCHARD.

Three years of spraying, pruning and cultivation will bring an orchard that you are ashamed of into a condition that you will be proud of.

If you think of setting out an orchard and have had no experience, better hire a good man to show you how.

The inexperienced planter thinks he is getting a bargain when he buys trees three or four years old, but experience will show him that yearlings are better and he should never plant anything over two-year-olds.

Always buy clean, straight trees with short stems, and even then do not be afraid to prune before planting.—Journal of Agriculture.

Walnut growers are hoping for a 15 cent price.

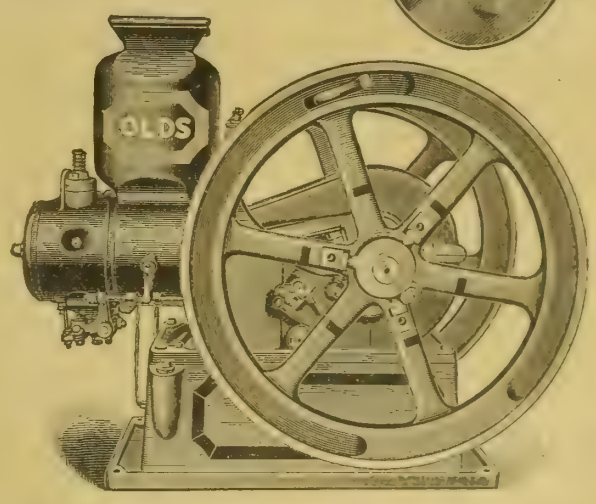
FREE this real leather bill fold for the Head of the Farm

(Not for boys—they're all right and their turn will come later—but this is for the boss.)

Thousands of farmers will buy gasoline engines this Summer and Fall. I want to get in direct and personal touch with every one of them, as I want them to know about the Olds Engine.

If you are going to buy an engine, or are thinking about it, you ought to know what an Olds Engine will do for you. I want to tell you about them—give you just the information you want—so if you will fill out the coupon below (or write me a letter) saying what size engine you want, whether portable or stationary, and when you expect to need one, without asking you to make any promise or obligating you in any way, *I will send you absolutely free* this genuine calfskin bill fold, stamped with your name in gold letters.

It will hold fifteen bills easily. When folded it will go in a small pocket. It is very convenient, handsome and useful; will last a lifetime. Has no advertisement on it.



OLDS GASOLINE ENGINES

are known the world over and used by farmers everywhere. They are the most satisfactory engine made for farm work. I guarantee them to do all we say they will —you to be the judge. Ask any man who has an Olds Engine. He will tell you.

We also make complete electric light and water systems especially for farms.

Write for our prices on corn shellers, corn huskers, feed grinders and cream separators.

If you are going to buy an engine, put a check mark (X) in the place showing the size and style engine you want, and when you expect to need it, and mail to me personally at once. Address me as below.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

EDUCATIONAL BUTTER SCORING CONTEST.

By Leon M. Davis, University Farm.

The bad effects of hot weather were plainly shown in the butter which was send in to the fourth scoring of the California butter contest. The number of entries received, however, shows that the participating butter makers are not quitters, but are determined to stay with the contest, regardless of a lack of ideal conditions.

The scores, 90 or above, as placed by Mr. W. B. Thurston, federal dairyman, and members of the Dairy Department, were as follows:

Creamery— Location	Score
Suisun Creamery, Suisun	94
Salinas Creamery, Salinas	93½
University Farm Cr., Davis	93
Laton Co-op. Creamery, Laton	93
Cottonwood Cr., Cottonwood	92½
Grizzly Bluff Cr., Grizzly Bluff	92
Dairyman's Co-op. Cr., Tulare	91½
Cal. Polyt. School Cr., San Luis Obispo	91
Glenn Co. Cold Stg. & Cr. Co., Willows	91
Visalia Co-op. Cr., Visalia	91
Ceres Creamery, Ceres	90½
Santa Rosa Cr., Santa Rosa	90½
Santa Ysabel Cr., Paso Robles	90
Bay View Creamery, Napa	90

Much of our poor butter at this time of the year is due to the extreme hot weather, but reports from creameries seem to indicate that their cream supply could be improved upon by more care on the part of the producers. The several criticisms for "dirty flavor," "cowy flavor," etc., should not have been necessary and would not were cream produced under proper methods. The importance of some form of protection for cream in transit is emphasized by such statements as: "This cream arrived with an acidity of 48 per cent and a temperature of 90 degrees F," or, "The temperature of the mixed cream just after receiving was 100 degrees." The use of can jackets, or at least some form of cover is necessary at this season if flavor defects are to be eliminated. Butter makers must use their influence among patrons to this end. Poor off flavor butter is likely to result unless the butter maker exerts every effort toward the use of good methods in handling, frequent deliveries, early delivery, cooling cream, and keeping cream covered in transit. Over 50 per cent of the entries were criticized to a more or less degree for old bad cream flavors.

There were several cubes of highly salted and gritty butter. It is often necessary to salt high when working with poor, high acid cream, but even then there must be a limit. One maker defends his high salt content with the statement that his market offers no complaint. It is true that there are markets which call for highly salted butter, and that the creamery must supply this demand. Still, very few customers are pleased by being supplied with gritty butter. Where it is desired to incorporate a large amount of salt, the wet salting method is advisable, as this tends to reduce salt defects.

The few defects under body seem to be closely associated with temperatures employed in washing. One method blank reports the churning temperature as 52 degrees, the buttermilk as 63 degrees, and the wash water as 57 degrees. With such variations as these, there are likely to be criticisms under body. What the consumer asks for is a butter which will spread well and which is neither too firm or too brittle, nor too soft and greasy.

Most contestants are to be congratulated on the appearance of their package. Although few butter makers have the time to prepare finely finished boxes, still a clean, neat cube is expected. There can be no excuse for anything else. Irregular lines detract very much from the good appearance of a cube.

One or two butter makers have expressed the desire of having their butter returned to them after scoring has taken place, in order that they may detect for themselves any unfavorable criticisms. Such requests as this will be granted, and the later examination by the maker will permit not only the comparison of his score with that of the official judge, but also will enable him to learn of the keeping quality of his butter. The contest is conducted not merely for the prizes which are to be awarded, but for better butter, and anything in the interest of this will work a benefit upon the butter makers of the state who participate.

THE GREATEST CHEESE.

The National Dairy Show is going to have another mammoth cheese on exhibition at the coming show to be held in Chicago, at the International Live Stock Amphitheater, October 26 to November 4, 1911. This time it is going to be the "greatest ever." The cheese exhibited at the last dairy show weighed over 4,000 pounds, and was the largest cheddar cheese ever made. This year's cheese will weigh over 10,000 pounds, and will take sixty-five tons of milk and cream from 6,500 cows, milked by 1,350 men. Eighteen expert cheese makers and twenty-five assistants will be employed in the construction of the cheese, which will be transported to Chicago in a specially constructed refrigerator occupying an entire flat car.

The entry comes from Mr. N. Simon, of Wisconsin, who also made the big cheese last year. It is not built alone for exhibition purposes, but will be of the finest commercial quality. The world's greatest cheese will undoubtedly attract widespread attention, and every means will be adopted by the officials of the National Dairy Show for exhibiting it in the most attractive manner.

A silo that will hold 100 tons, which is a good silo for an ordinary farm, can be erected at a cost not far from $300. Interest on $300 is a small consideration when it enables one to keep well all of his live stock, or when the lack of such a structure means a reduction in the live stock kept, or at least a reduction in income from the stock. There are many farms, of course, on which it is not advisable to build silos at present; but any ordinary farm, on which enough live stock is kept to maintain its productivity, affords a condition under which the proposition to erect a silo should at least receive careful consideration.—A. D. Wilson, Supt. Extension Division, Minn. College of Agriculture.

FORM COW TESTING ASSOCIATIONS.

Leroy Anderson, of the College of Agriculture, University of California, has been appointed to look after the cow testing association work in this state by Mr. Helmar Rabild, who is in charge of dairy farming investigations of the United States Department of Agriculture. Mr. Rabild writes that he desires Professor Anderson to assume entire charge of the work in California. There are a few cow testing associations in the state and it is hoped that others may soon be organized in dairy sections where there are enough cows to warrant paying the services of a man to do the testing. The associations are growing in number and importance in the dairy sections of the eastern states. Dairymen, who are members of such associations, are almost unanimous in their approval of the system and in the uniformly valuable results which they obtain in the way of information about their cows. If any dairymen or farmers clubs desire to form a testing association they ought to correspond with Professor Anderson, who will be glad to send them literature describing the associations, and he will visit them personally if it is possible for him to do so.

MILCH GOATS.

Mr. Fred Hansen, of Carpinteria, writes regarding the milch goat situation, and refers to his own flock. He says he has a fine bunch, which he began gathering together some three years ago. At that time he had four good does and an imported buck, and has raised over forty goats from that start. He thinks "the Saanen better than any other breed, and especially like their appearance. We are milking some twenty of them this year, having had more than we can handle."

"We have had trouble in shipping milch goats long distances. They will not go without milking, or, if they do, are liable to go dry. We find it better to ship the goats or young kids three or four in a crate. This is cheaper, and the youngsters are less liable to be affected with homesickness."

"We find them most satisfactory in clearing brush land. We bought ten acres of such land, and they have cleaned it up for us. Fenced in a small patch at first, and later moved the fence as needed. Bean straw makes an excellent addition to their fresh forage, and we have always found them very easily kept."

A dairyman of experience says it is not always necessary to use the trocar in cases of bloat in cattle. His advice is to use a fourth to a third of a teacupful of kerosene in an equal amount of water in a long, heavy-necked drenching bottle. After drenching the animal, fasten a smooth stick two inches in diameter in the mouth so it cannot avoid belching and the consequent escape of the gas. If the case is well advanced when discovered, and water is not convenient, do not waste time getting it, but give the oil straight—it will do no harm. If relief does not come in an hour or so, repeat the dose.

The hog is such a free eater and rapid grower that the mistake of feeding him too heavily is often made. This is of course a double mistake, inasmuch as it arrests the best development of the hog and results in a loss of feed. There is absolutely no use in crowding more feed into the willing hog than he can digest and assimilate. This means waste of feed. The object in good hog feeding is not to get the hog to "work up" a large amount of corn and other feeds, but to make the largest gains on such feeds as he may eat and continue to keep his appetite.

The ideal udder should lie evenly balanced in front and behind, should be covered with soft velvety hair, be free of fleshiness and blemishes, and be very pliable and soft, when not full of milk, it should be large enough to allow of growth of cells necessary in the manufacture of milk, and should extend well back between the thighs. The teats should be shapely, of good size and evenly placed.

You cannot afford to breed good cows to a scrub bull. Heifer calves of good breeding will determine your future success in the dairy business. If you have more good heifers than you need for your own herd you can easily dispose of them for good money to others.

Record keeping tends to increase the milk production of the herd by the elimination process.

The proper way to prevent odors and flavors is to feed pure and wholesome feed, give the cow nothing but pure water from deep wells, see that the barn is clean and the ventilation perfect, keep the utensils clean and weed out all the diseased animals from the herd.

Make the acre the unit of measures in considering the dairy receipts. Then try to make each acre produce the largest possible returns. When this is attempted, the dairyman will find himself enriching his soil instead of robbing it.

The ration for the dairy cow should be bulky, well balanced, palatable, digestible and economical.

Sugar-Beet-Pulp takes the place of green grass and is the best butter producer in the world. 50 cents per ton at Los Alamitos Sugar Factory.

MARKETING THE SUGAR BEET.

By R. L. Adams.

A constant supply of raw material is one of the essentials of a successful campaign for a beet sugar mill. The cost of labor is high and the operating expense is great. Failure to secure beets enough day by day to keep the mill running steadily results in a heavy financial loss as the expense of running at half capacity is way out of proportion to the amount of beets run through. In order to secure the necessary beets the mill asks that contracts for the crop be signed early in the season—even before the seed is sown. This method works out to the benefit of both mill and grower. The latter is assured of his market and price from the very start. He need not figure on a fluctuating market, for he can tell pretty accurately what his expenses will be and from this and his probable profits can deduce his profits.

The terms of the contract give the grower the privilege of securing seed through the company. As this seed is purchased by the mill in large quantities the grower receives the benefit of a cheaper price for the seed, cheaper freight rates, tested seed, and redress in case of legitimate complaint. With best seed the inherent characteristics which are bred into the seed to a great extent determine its value in the field, although of course local environment is still more important. Only through systematic organization and careful inquiry can the exact status of any seed be determined. The determination of the history and character of the seed is in itself a matter requiring too much care and attention for the average grower to follow up.

The agricultural force of a sugar mill is intimately concerned with the future of all sugar beets grown, and the services of an experienced field superintendent and his corps of able assistants is constantly at the command of the grower, to aid him in bringing his crop to a successful harvest. Advice as to the best methods to pursue in growing the beets, and in securing help to handle the crop, and demonstration of ways to control insects, weeds and plant diseases, are but a suggestion of the help which the mill agriculturist stands ready to give at a mere hint of need on the part of a grower.

And should financial assistance be needed to carry the crop, the sugar beet will be considered an excellent asset and local banks, or even the sugar company itself stands ready to lend financial aid.

The mill asks a contract for itself in order to be assured of a sufficient supply of beets to insure a profitable run. It also needs an approximate idea of the expected tonnage in order to purchase the right amount of supplies for the campaign, something which must be done in advance of the run, and to estimate and plan for the necessary amount of labor to handle the crop at the mill.

It is therefore advantageous to both parties to sign the contract, which in itself, is a simple instrument designed for the protection of both parties.

In drawing contracts the basis of payment is usually of most interest to the grower. The terms of contracts vary from one mill to another, but all consist of one of two kinds—the purchase of the beets on a flat tonnage basis, or else on a sliding scale base on the sugar content of the beets. Some mills offer a choice of the two ways at the option of the grower. In offering a certain kind of contract the idea of a bonus feature is carried with it. That is, the mill offers the growers the contract which will produce the results desired at the mill. If more beets are wanted a flat rate based on tonnage of beets delivered is offered. If the quantity of the receipts is satisfactory, but the quality poor, a contract is drawn up which places a premium upon rich beets. Should an improvement be sought along the lines of both greater quantity of beets and a higher percent of sugar, a choice of contracts is offered. In each case, however, the contract carries with it a bonus by offering an advance price in order to encourage greater efforts along the desired lines. For instance, some mills offer $4.00 per ton for beets testing 12 per cent with a 33 1-3 cent increase for every additional per cent of sugar. Or they offer a choice to the grower of this schedule or one of a flat rate of say $4.50 per ton based on the amount delivered.

It will pay every grower well to inquire into the wishes of the company in this matter and into the capacity of his land for raising beets. It is wisdom to raise beets in accordance with the company's needs for what they want most is what they stand in greatest need of, and consequently are willing to pay more for. Taking the above rates, for instance. If a grower's land will produce a maximum crop of 12 tons of 18 per cent beets or 16 tons of 12 per cent beets, limits within easy reach of many growers depending of course on the character of the land, he should study the pay schedule well in order to determine in what way he will receive the greatest returns.

Figured on a percentage basis he will receive: $72 per acre for his 10 tons of 18 per cent beets; $64 per acre for his 16 tons of 12 per cent beets.

Figuring on his tonnage rates he will receive: $50 for his 10-ton crop of 18 per cent beets; $80 for his 15-ton crop of 12 per cent beets.

Under the first schedule of payment it will therefore pay him best to raise the smaller but richer crop; while the reverse is true when figuring on a tonnage basis.

The number of examples might be multiplied indefinitely, but this one will serve to point the moral, and show the need for giving careful study to the subject. Taken in connection with the character of the land and the cost of labor, much headway can be made in getting the greatest returns from the land. Moist, heavy, rich land will grow heavy beets relatively low in sugar; while the sandier class of lands tend to produce small beets rich in sugar. When the cost of labor is high the item of handling a small rich crop will usually offset the greater financial returns secured from the heavier crops. This is a variable factor and probably is not alike in any two sections. The working out of crop receipts, expenses and profits is therefore an individual matter and can only be decided by each grower for himself. It is human nature to want to profit most for the labor involved and the suggestion is therefore made that careful inquiry be directed towards determining the best paying contract. If tonnage is wanted by the mill, select the heaviest, best producing land. If it is quality, figure on tonnage, cost and receipts in order to determine the beet of a sugar content most profitable. If a choice is offered spend plenty of time on working out the method of payment which will most profitably reward you for your labors.

KILL CHIPMUNKS.

Commenting on a recent Bulletin, Mr. E. F. Adams, of the San Francisco Chronicle, says:

"A circular of the Biological Survey says that one of the most serious problems connected with the reforestation of treeless areas within the national forests is the protection of newly planted seeds from the attacks of mice, chipmunks, ground squirrels and other rodents whose depredations collectively continue the year through. The extent of this damage may be understood by the results of a reforesting experiment in the Black Hills by the forest service, in which from 30 to 70 per cent of the seed was destroyed by chipmunks and mice within six days after planting. In order to get an idea of the abundance of these rodents, exhaustive trapping on a half acre containing 2,000 seed spots was undertaken. They secured three chipmunks and eleven white-footed mice, which in three days had pilfered 70 per cent of the seed. One of the chipmunks was seen to visit thirty-eight seed spots in four minutes. It will be readily perceived that the destruction of seed on such a scale threatens the practicability of reforestation. Annoyed in this way, instead of proceeding as ordinary mortals would proceed to kill off the pests, the 'scientists' of the forest service flunked and called in another full-fledged 'scientific service'—the Biological Survey—which proceeded to set traps, put out poisoned grain and go hunting with shotguns. Scientists are as particular about 'jurisdiction' as labor unions. It would be bad form for tree planters to hunt chipmunks. If it is thought necessary to maintain a scientific department for the extermination of small rodents, the chances are that the cheapest and most effective plan would be to let the contract to the nearest tribe of Indians. They probably would not issue any bulletins, but they would kill the chipmunks. It is not best to run 'science' into the ground, nor does it pay to maintain a costly department in Washington to oversee the killing of chipmunks in Idaho. The circular gives the usual formula for preparing poisoned grain, says that small steel traps carefully concealed are the best traps for catching these rodents, states that bisulphide of carbon is the best chemical for destroying burrowing animals, and gives the following suggestions about distributing the poisoned grain:

"'Ordinarily, in distributing poisoned wheat, about twenty kernels should be dropped every three or four feet along parallel lines five yards apart, an extra quantity being left under logs and shelving boulders. At this rate a bushel of wheat is sufficient for about forty acres. In certain dry regions, however, where vegetation and the mammals subsisting upon it are mainly concentrated on favorable slopes and along streams, waste of bait may be avoided by putting out in larger or smaller quantities according to the varying numbers of the pests. Where they are scarce, it need be put only under logs and stones and in similar retreats. The particular kinds of rodents likely to do mischief and the way they are distributed in any given locality may be determined by careful observations and a little preliminary trapping.

"'Poisoned bait may be protected from rain and guarded from birds or poultry by placing it under pieces of bark or little piles of stones. Such shelters are favorite haunts of small rodents.

"'Mice and chipmunks are more easily poisoned in spring, when food is scarce, than when seeds and fruits are ripe and insects plentiful. It is advisable, therefore, to distribute poison early in the season, regardless of the time of planting seed. When seeding is to be done in summer or autumn, the rodents should be destroyed over a somewhat larger area than is designed to be seeded, in order to prevent invasion from surrounding territory.

"'While poisoned grain may be distributed with fair speed by hand, it can be done more expeditiously by using a sack. This sack, which is made of denim or other strong cloth, has a shoulder strap and a narrow wooden bottom fitted with a simple dropping device. By alternately pulling and pushing the sliding measure the operator can drop the grain without stopping.'"

SUBIRRIGATION.

We recently had inquiry from Arizona as to subirrigation in California. Personally we did not know of any successful trial of subirrigation for any length of time. We wrote to Mr. Adams, in charge of the government investigations in irrigation at Berkeley, and to his assistant, Mr. C. E. Tait, in charge of investigations at Pomona. Neither are aware of any pronounced successes with this system, which in theory has always appealed to every irrigator, and in practice has ultimately resulted in failure. The inquiry referred especially to the "asbestine" system, as to what it was and how it worked. We have been unable to learn of any such system.

Subirrigation of Onions.

Mr. Tait referred to a subirrigation system in vogue for onions in the Willamette Valley of Oregon. It consists of a channel of two 2x6 planks on edge, six inches apart, and twenty-two inches under the surface. The top is covered with shakes running crosswise, lapping over each other so as to make a small opening, permitting the water to escape when the channel is filled. The channels are placed sixteen inches apart, and presumably the rows of onions are planted about the same distance apart.

One-inch boards were tried for the sides of this underground pipe, but were too thin. The onions being an annual crop, the roots do not get into the channel or conduit, and the system has been described as working fairly successfully.

Plan Tried at Pomona.

Another plan which was tried near Pomona was much more expensive to install. To prevent roots from entering openings of perforated pipe, the water was conducted underneath the orchard in regular screw pipe. At intervals a tee was located, and in this tee was screwed an upright long enough to stand above the surface of the ground, and slots were sawn in the lower or screw end. When the pipe was screwed into the tee these slots were closed, and the water could not escape, but at time of irrigation the attendant applied his wrench and made a certain number of turns which he knew would bring the slits in the lower end of the pipe out of the tee, so the water would escape. On finishing irrigation the pipe was again screwed down to prevent roots entering. One tee was placed at each row.

This system was installed fifteen years ago, but the size of the openings was not sufficient, and the expense of increasing the number, and the objection of the pipes projecting through the ground and hindering cultivation, prevented the extension of the system. Regarding other subirrigation schemes Mr. Tait writes:

Texas Experimenting.

"A pipe for subirrigation is being manufactured at Austin, Texas, and I understand that it is looked upon with favor in the Gulf Coast region, but I have not heard that it has actually been tried. It is a new thing, and will, I suppose, be tested this season, so that in a few months we will be able to learn something about its service. This pipe is described as a concrete tile in which the upper half consists of large pebbles held together by a thin coating of cement. The pores in the pipe are said to give sufficient opening for the water to pass into the soil, and it is claimed that the course of the openings is so tortuous that roots cannot find their way to the inside of the pipe. Another form of the same pipe consists of solid pipe with holes either in the top or bottom, filled with plugs of porous material. Personally I would want to see the pipe tried for a few seasons before being satisfied that roots would not enter

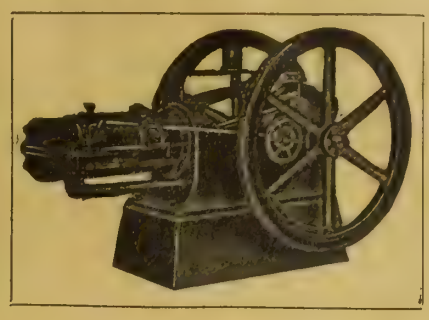
WHY NOT BE UP TO DATE



The COMMERCIAL ENGINE Is Kept Strictly ABREAST of the TIMES

Our 1911 Catalogue Showing 1912 Construction Can be Had by Writing

The COMMERCIAL ENGINE CO.

951-953 No. Main St., Los Angeles, Cal.

Fresh Avocado Seed

(Alligator Pear)

For July and August Delivery, $4.00 per 100, $35.00 per 1000 by express, and instructions for planting, etc., with each order.

C. W. Wilhite

Home Phone 2062 Glendora, Cal.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 142, 143.

ARE WE TO BE HANDED A LEMON?

With the state of New York naming forty-five members of the electoral college and California approximately one-fourth that number, it goes without saying that the shrewd politician will curry favor with the New York importers rather than with California lemon producers, and unfortunately, protection of the various industries of this country has more to do with protecting politics than with actual protection of producers. If politics is responsible for the situation which confronts lemon growers, it has been shrewdly brought about at Washington. Lemon growers and their agents have been resting easy, not expecting this matter to be brought up for some time, but the bolt dropped from a clear sky last week, and whether it caught California representatives and senators napping or not, a situation was created which calls for strenuous effort on the part of those who have invested millions and now see the possibility of all those millions being wiped out of existence. These millions are not in the hands of a trust or of people of great wealth, as is charged by the importers, but largely in the hands of homemakers who have come to this state to engage in fruit culture under our favorable conditions. It is unthinkable that these people should be made to suffer, but the strong fight being put up by the importers and their friends calls for immediate and strenuous action to preserve the industry and secure for our state the investment of still further millions of dollars and energy of thousands of fruit growers.

The industry has been slowly increased until this year our greatest production of lemons has been reached. At this time the shipments since November 1st, 1910, are somewhat less than 6000 cars. The increase has not been caused by any exorbitant prices received. It must be admitted that during the recent hot spell the shortage was so great, with but few foreigns coming in, and the demand so keen, that prices did go above normal and growers received much of the benefit, but that condition would have obtained with any industry and was not the result of protection. Taken the year through, we believe the statement which has been made that cheaper lemons will be given to the consumer under protection than under the destruction of the industry and allowing the importers to control it, is true.

It goes without saying that with labor in Italy and the Islands of the Mediterranean practically one-third that in California and transportation to Atlantic seaboard points practically one-fourth what Californians have to pay, Mediterranean produced lemons would have such an advantage over the California product that at least two-thirds of this country's markets could not be reached by California lemons. If this did not result in the absolute wiping out of the lemon industry, it would so cripple it that before many years the Mediterranean producers would have to be looked to for practically all the lemons this country should consume. When that moment arrives, Easterners may look to the time when California lemons were given a cent and a half protection and were sold cheaper than the inferior Mediterranean product.

Not only every lemon grower, but every well-wisher of California's future sholud write to his congressman and senators presenting these facts and urging a most strenuous effort to offset the claims of the importers who are backed by an immense lobby fund secured from every box of lemons imported into the United States.

GREAT FIRE DAMAGE.

Whether the damage to the lumber and fruit interests of Southern California from the fires which have raged over the Sierra Madre in San Bernardino County has reached $8,000,000, as estimated by some, or $15,000,000, as estimated by others, it is such that if it can ever be repaired it will require years. Watersheds covered deep with leaf mold and shaded by dense growth have become barren, covered only with ashes, which will permit the first rains to carry away what little soil covers the rocks. On many of the burned over sections the Tri-Counties Reforestation Commitee, the county, the state and even the nation, have joined in extensive planting. This will all have to be done over and with less probability of favorable results because of the barren soil conditions which this fire will create.

The efforts to control the flames have cost at least one life, and much heroism has been shown. There seems to be a diversity of opinion as to the judgment of the leaders in the fire fighting. Hundreds of men have been at the command of Forest Supervisor Charlton and his helpers, and the bills to be presented to the government will doubtless aggregate a large sum. Many feel that Mr. Charlton's direction of the fighting forces has not shown the judgment which should be shown by one in his position. As to this, we cannot say, and we know that under such fearful loss those interested are liable to judge unjustly, but if the daily press of the southern part of the state reports correctly the expression of officials in charge, they have been unduly hopeful. When the fires had already done fearful damage it was reported in the papers that Supervisor Charlton and others spoke of it as a very small matter. If this is the case, those in charge have not appreciated the magnitude of the situation, and if not, of course have not used proper energy to sooner subdue the fire.

After stating that it is easy to sit in an office and criticize the fighters on the line, the San Bernardino Sun says:

"Without qualification or limitation of any kind, it has been an absolute, complete, inexcusable and indefensible failure, that calls for drastic action, although that will not restore the magnificent trees that have been hundreds of years in maturing, nor bring back the forest cover of the hills, whose bare and denuded sides will send sweeping floods through this city and valley next winter and in succeeding winters, until nature's kindly hand shall have covered the scar, and a decade or two hence may have begun to undo the harm wrought in these seven days of destruction.

"This criticism is not aimed at the rangers who have gone without sleep and worked night and day under superior but incompetent authority, nor does it reach the laborers who for the pittance of 25 cents an hour have faced heat from the furnace canyons equal to that of the gates of Gehenna itself. But it does apply to the men whom the government has sent here to try to do something, the very rudiments of which they do not know."

The Highway Commission appointed by Governor Johnson to have charge of the $18,000,000 road fund voted last fall, consists of Chas. D. Blaney of Santa Clara, Burton A. Towne of Lodi, and N. D. Darlington of Los Angeles. These men are all declared to be enthusiastic for good roads and thoroughly qualified for the position.

TWENTY-FIVE POUNDS NITRATE OF SODA TO THE TREE.

In the report of Prof. C. B. Lipman's address at the Pomona meeting of the Claremont Club the Cultivator made Prof. Lipman say that Prof. Norton had applied 25 pounds of nitrate of soda each year for four years to some orange trees. Professor Lipman writes that this is an error. He says:

"The statement mentioned attributes to me the responsibility for saying that Prof. Norton has been applying 25 pounds of nitrate of soda to some trees each year for four years. This is manifestly impossible since Prof. Norton has only been in the state a little over three years. I have known such applications made on a citrus grove near Reedley for a period of four years and was further informed by one grower at the soil convention last October that he had made applications of twelve pounds per tree per year for eight years and another also made a similar statement, and both claimed that their trees were not only bearing heavily but were in fine condition. In the case of Prof. Norton's trees, however, the applications were made in one or two seasons, I believe, but cannot say exactly. However, Prof. Norton has told me on one or two occasions that the tree thus treated with nitrate of soda showed no effects from it whatever, which he could notice."

Californians are generally elated at the appointment of Louis R. Glavis, formerly connected with the United States forestry service and one of the factors in the clash with former Secretary Ballinger, as joint secretary of the California Conservation Commission and the California Conservation Board of Control. It is hinted that the salary has been fixed at $5000 per year. These commissions have been formed under the act of the last state legislature. The Board of Control will have charge of all water power filings to be made in the state.

Forester Homans reports that during 1910 there were 738 brush, grass and forest fires in the state. This is a material increase over the preceding year. The fires were of three classes: small, put out by one man, fires covering ten acres, and others causing great loss and trouble. The acreage covered by these fires was 654. Standing timber valued at nearly $1,000,000 went up in smoke. The one fire near San Bernardino this year will cause greater loss than all of last year's fires in the state.

The Los Angeles County Chamber of Commerce proposes to make a display at the coming state fair which will pull down those 600 plunks offered for the best county exhibit. To that end the fruit growers and farmers of the county are asked to send in fine specimens of fruits, pumpkins, etc. Secretary Wiggins is taking a personal interest in the matter and hopes the farmers will respond liberally.

A subscriber at Los Gatos calls attention to an error on the cover page of the last issue of the Cultivator in which we give credit for the location of "Big Bridge" as near Palo Alto. The bridge is really located in Santa Clara County, but a score of miles from Palo Alto, and is in the town of Los Gatos.

Stephen Strong is fully installed in the work of quarantine officer at the ports of Los Angeles and San Diego. Several vessels have been inspected and some fruit destroyed because of possible infestation. The San Diego office, while under the direction of Mr. Strong, is in charge of Mr. Jeffrey Junior.

Agricultural News Notes of the Pacific Coast

Northern California

Bartlett pears have commanded excellent prices.

Artesian water has been found at Germantown, Glenn County.

Yuba County will require the help of 2000 people to pick its hop crop.

Healdsburg peach growers have been selling good grade peaches at 10 cents.

Marysville irrigators are planning a tunnel to secure more efficient intake of water.

One Lodi grape grower has disposed of his crop for a lump sum of $100 per acre.

The sugar factory at Hamilton City anticipates a longer campaign than ever before.

Hop growers are pleased at the outlook, the holdover crop being practically all disposed of.

Grape growers of the Sacramento Valley have formed the Grape Growers' Association of California.

Fruit evaporators at Sebastopol, Sonoma County, are already forwarding high-grade evaporated apples.

Placerville, Eldorado County, reports an immense crop of Bartlett pears with promise of excellent prices.

The recent warm spell is reported to have done some injury to prunes and grapes near Woodland, Yolo County.

The government experiment station at Laramie, Wyoming, is purchasing pure bred Rambouillet sheep of a Yolo County stock farm.

The Gridley cannery is running full capacity on peaches and plums. A greater number of hands are employed than formerly.

Dredgers are busy constructing new levees around the new reclamation district in Yolo County. 1000 acres will be reclaimed.

One orchard in Sutter County near Yuba City has shipped 500 tons of choice peaches. It is claimed the price will be over $60 per ton.

The Gravenstein apple show at Sebastopol has been deferred one week because of the lateness of the season. It will open Monday morning, August 21st.

A new irrigation scheme has been launched in Butte and Yuba Counties by San Francisco capitalists which will reclaim and irrigate 70,000 acres of fine land.

Stockholders of the newly organized Quincy Creamery Company recently held their first meeting at Quincy, Plumas County. By-laws have been adopted and a lot purchased for the erection of a creamery.

The shortage of fresh deciduous fruits is emphatically shown in the fact that the pre-cooling plant at Roseville has this year handled an average of only about forty cars daily, while last year it handled approximately 200 per day.

It is claimed that the Great Western Power Company will soon begin the work of erecting a chain of three additional power plants, which will represent an investment of $15,000,000 to $20,000,000. They will be located on the north fork of the Feather River and will have a capacity of 500,000 horsepower.

Central California

Fresno County is making a clean-up campaign on ground squirrels.

Reedley plum growers have been elated over returns of over $2.40 per crate.

Reedley, Fresno County, is shipping carlots of melons to Portland and Seattle.

Sunnyvale, Santa Clara County, reports canneries busy on apricots and berries.

Dairymen of Goshen, Tulare County, are planning for a co-operative creamery.

The Dairymen's Protective Association of Dos Palos is building a new creamery.

Fresno made a seeded raisin exhibit at the National Realty Convention held at Denver.

The Pajaro Valley does not anticipate shipping of apples to any extent before September 1st.

Kern County board of supervisors declares the ground squirrel must go and an active campaign is planned.

The cannery at Hanford, Kings County, now employing 500 people, is running principally on Tuscan Clings.

Much talk is being indulged in regarding the construction of a railway from Fresno to tidewater at Monterey.

The San Jose Grange listened to an address by Irrigation Expert Adams of the government service at its last meeting.

The farmers of Soquel Grange have passed resolutions urging the formation of a farmers' mutual insurance company.

A deputy state veterinarian has been destroying several horses at Hanford, Kings County, because of glanders.

Fruit growers at Dinuba, Tulare County, report the crop of Muscats much better than anticipated earlier in the season.

The first shipment of apples for the season from Santa Cruz County was by the San Monte Company of Watsonville about the middle of July. It was of Red Astrachans.

Nineteen two-horse wagonloads and nine four-horse loads of watermelons were lined up in the waiting list before the freight depot at Reedley, Fresno County, one morning last week.

The Pajaro Valley apple orchards now promise a bumper crop of Newtown Pippins, with Bellefleurs under normal. Some predict that the output of Newtowns will be at least 75 per cent greater than last year's.

One peach buyer at Fresno estimates the crop will be very short. Last year's output was 26,000 tons, and he estimates this year's will not exceed 15,600. Of this, the San Joaquin district will produce about 7600 tons.

The orange drop which usually occurs in late June or early July in groves of Tulare County did not occur as early as usual this year, and for a time it was hoped an immense crop would remain on the trees. Within the last few days, however, the drop has been very severe and not more than 75 per cent of a crop is anticipated at this time.

Southern California

The Chino sugar factory started on its first slicing July 31st.

California produced lima beans last year to the value of $4,176,000.

Lima bean growers held their annual meeting at Oxnard last Saturday.

Estimates of the coming orange crop are that it will be exceptionally heavy.

Apricot dryers are playing a waiting game, 14 cents having been freely offered.

Los Angeles county claims a return this year of $5,000,000 from citrus fruits.

Coachella Valley onion planters are getting fields ready for the next season's crop.

Highland, San Bernardino County, has shipped its last car of oranges for the season.

Early grapes from Brawley, Imperial County, commanded $2400 and $3400 per car.

One Escondido apricot grower will clean up about $4500 from forty-five acres this season.

Lemon growers have been greatly concerned over the possible removal of the lemon tariff.

The Escondido Valley Poultry Association will hold its annual show Dec. 6-8 in Escondido.

Smeltzer, Orange County, reports the planting of about 1600 acres of celery. Planting is practically all finished.

The Valencias on the C. C. Chapman ranch at Fullerton are being shipped from a new packing house.

Coachella Valley, Riverside County, has been shipping early grapes which have been averaging $2600 to $3400 a car.

It is reported that 30 tons of water white honey has been contracted for at Fillmore, Ventura County, for 7 cents.

Bean buyers not connected with the Lima Bean Growers' Association are holding off and making no offers for the coming crop.

Victoria Avenue Citrus Association of Riverside will make a material addition to their packing house before the next season opens.

Kenneth McRae maintains that plowsole or hardpan is responsible for citrus tree deterioration and that soil preparation will effect renewal of the tree.

Los Angeles is already planning for the celebration of the bringing of water from Owens Valley, which will be held a year or possibly two years later.

The great forest fire in the mountains north of San Bernardino has finally burned itself out after causing a loss variously estimated at from $8,000,000 to $15,000,000.

The high water stage of the Colorado has passed and the patrol which has been watching the situation in the interests of the Imperial Valley irrigation people has been withdrawn.

A lawsuit covering a period of weeks is drawing to a close in Los Angeles County. It was between the irrigators of the Santa Ana Valley and those of Riverside and San Bernardino Counties.

The Coast

Utah State Fair will open on Monday, October 2nd.

Bellingham, Washington, has the biggest hay crop yet.

Alfalfa seed harvest is in full swing in the fields near Yuma.

Hay producers at Roseburg, Oregon, are selling at $12 per ton.

Much damage was done by summer rains near Globe, Arizona.

Fruit crop at Chehallis, Washington, will be 75 per cent of normal.

The Yakima Valley, Washington, will ship out 4000 cars of hay.

Grand View, Washington, has just shipped out forty cars of potatoes.

The next territorial fair at Phoenix, Arizona, will be held November 6-11.

Shipments of cantaloupes from various Arizona points aggregated about 1200 cars.

Portland, Oregon, will attempt to make a success of the silk industry in a large way.

Toppenish, Washington, has 35,000 acres in alfalfa and will market 200,000 tons this season.

The state veterinarian of Washington is planning to make a tuberculin test on over 400 cows.

The Yakima Valley shipped 140 cars of hops last year which will be increased to 180 this year.

La Conner, Washington, will produce about 1,440,000 bushels of oats this year as compared to 1,800,000 last year.

Apple orchards of Ravalli County, Montana, are carrying a very light crop because of serious injury from late frosts.

The Yuma Valley, Arizona, is producing some of the finest Muscats. It is expected this crop will be one of the money makers of that section.

The hay crop at Grandview, Washington, will be much heavier than last year, the shipments from that section at that time aggregating 550 cars.

South Bend, Washington, has greatly increased its acreage of cranberries during the past year. The section will ship 2000 barrels of berries this season.

The farmers of the Walla Walla Valley, Washington, predict that if Canada accepts the reciprocity plan barley will not continue to be produced in that section.

President Yoakum of the Frisco lines stated before a farmers' congress at College, Texas, that it costs $7,000,000,000 to get the $9,000,000,000 worth of farm products to the consumer.

A convention at Salem, Oregon, passed resolutions urging the governor to call a special session of the legislature to make provision for changing the constitution so as to permit counties to incur indebtedness for good roads.

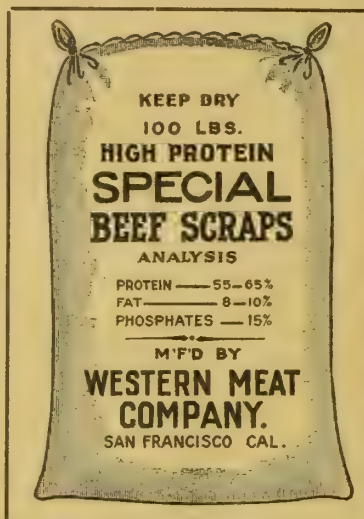
The Yakima Valley, Washington, estimates that the production of prunes this year will be about eighty cars this year as compared with 125 last year. The Walla Walla Valley will produce about 500 carloads as compared with 550 last year. The Willamette and Payette Valleys about a normal crop.

Animal Matter a Necessity For Poultry

Experiments at various State Experiment Stations have demonstrated beyond a doubt that Protein derived from an animal source is far superior, as an egg producer and flesh builder, to Protein derived from a vegetable source.

Our High Protein "Special" Beef Scraps Will Supply That Necessity

If your dealer cannot supply you, write us, and we will send you samples and price.



Made in California from fresh Packing House Products. Look for the word "Special" in red ink on every sack.

Western Meat Co., San Francisco, Cal.

Dried Milk for Fowls

Nothing better, especially in hot season; nearly 50% protein. Special prices for short time only:

Harding's, $3.50
Casein Co.'s, $3.50
Bent's, $3.75

5 Sacks 15c and 10 sacks 25c less

WEST COAST SEED HOUSE

111, 113, 115 WINSTON ST. between 4th and 5th near Main. LOS ANGELES

Catalogs of Everything for Poultry and the Garden

BUY LAYING HENS NOW

PRICES ARE LOWER RIGHT NOW THAN AT ANY OTHER time of the year. If you need hens take our advice and buy them right now. We can supply fine young White Leghorn yearling hens at $8.50 and $9 per dozen. No matter how many you wish, we can supply them at this price right now. These prices are good this month only. In July and August hens are worth more. In September these same hens will be selling at $12 and $15 per dozen. Buy them now and make a big saving. Send today for catalog of prices on baby chicks of all kinds, hens and pullets, etc.

THE PIONEER HATCHERY CO.
112 East 8th Street, Los Angeles

The Big State Fair

Sacramento, August 25th to September 2nd, 1911

The program and arrangements now completed settle it that the State Fair this year will be the biggest and best ever held in California. Besides the largest industrial and livestock exhibits, the ***Biggest Purses and Best Races,*** the program includes:

Military Bands **Chorus Singing** **Nightly Horse Show**
Thrilling Fireworks **Famous Aviators**
and Daring Daily Feats by Dare-devil Cowboys from all over America

Special Rates on All Railroads

Mills College
NEAR OAKLAND, CALIFORNIA

The only Woman's College on the Pacific Coast. Chartered 1885. Ideal climate. Entrance and graduation requirements equivalent to those of Standford and University of California. Well equipped laboratories. Grounds comprise one hundred and fifty acres. Special care for health, out-door life. Pres. Luella Clay Carson, A. M., Litt. D., LL. D. For catalogue address Secretary, Mills College P. O., Calif.

WINSLOW'S REDS
Annual Reduction Sale of Stock and Eggs.

Monrovia, Cal.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

SANTA CRUZ WINNERS.

The winners at the Santa Cruz show are proud of their awards because of the strong competition. The classes were exceptionally well filled in consideration of the season of the year. It takes some nerve on the part of poultrymen here to place their stock at moulting time on exhibit before those who are most critical, but the show was a good one and the management is pleased with the results. The awards were made by Judge A. H. Currier of Santa Rosa. Winnings were:

AMERICAN CLASS

Rhode Island Reds—Pen—1, Mrs. I. H. Tuttle; 2, Wm. M. Hirsch; 3, Jack Lee. Ck.—1, C. H. Smith; 2, Jack Lee; 3, C. F. Bliven. Ckl.—1, Bliven; 2 and 3, Hirsch. Hen—1, Hirsch; 2, Smith; 3, Lee. Pullets—1, Smith; 2 and 3, Hirsch.

Rose Comb Rhode Island Reds—Ck.—1, Hirsch; 2, Lee. Hen—1 and 2, Hirsch; 3, Lee.

Buff Wyandottes—Pen—1, Wm. C. Parker. Ck.—1, Parker.

White Wyandottes—Pen—1, A. L. Jenkins. Ck.—1, Jenkins. Ckl.—1 and 2, Jenkins. Hen—1 and 2, Jenkins. Pullets—1 and 2, Jenkins.

Barred Plymouth Rocks—Ck.—1, Thos. A. Atkinson. Hen—1, Atkinson.

White Plymouth Rocks—Pen—1, Mrs. D. A. Robertson; 2, Mrs. Robertson; 3, Thos. A. Atkinson. Ck.—1 and 2, Robertson; 3, Mrs. W. E. Vandervort. Ckl.—1, 2 and 3, Robertson. Hen—1 and 2, Robertson; 3, Atkinson. Pullets—1, 2 and 3, Robertson.

Buckeye—Ck. and Ckl.—1, W. W. Hirsch. Hen—1 and 2, Hirsch. Pullets—1 and 2, Hirsch.

ASIATIC CLASS.

Partridge Cochin—Hen—1, Wm. H. MacKay.

Buff Cochin—Pullets—1 and 2, Hirsch.

Light Brahmas—Hen—1, Bennett; 2, Jenkins. Ck. 1, Jenkins.

MEDITERRANEAN CLASS.

Black Minorcas—Ck.—1, David J. Lovell Co.; 2, L. E. McLellan. Ckl.—1, Lovell Co.; Hen—1, Lovell Co.; 2 and 3, C. C. Bonnell.

Blue Andalusians—Ckl. and Pullets—All to C. A. Whipple.

Buff Minorcas—Pen, Ckl. and Pullets—All to Mrs. I. H. Tuttle.

Brown Leghorns—Pullet—All to P. S. Lay. Hens—Same.

Single Comb White Leghorns—Pullet—1 and 2, Bennett. Ckl.—1, N. Duttbernd; 2 and 3, Duttbernd. Pen—1, Arthur Schroeder.

ENGLISH CLASS.

White Orpingtons—Pullets—1, 2 and 3, W. W. Smith. Ckl.—2, E. C. Abraham; 3, W. W. Smith.

Single Comb White Orpingtons—Hen—1, John D. Bennett.

Single Comb Black Orpingtons—Ck. 1, Wm. H. MacKay; 2, Bennett; 3, Harry B. Adair.

Single Comb Buff Orpingtons—Ck., Ckl., Hen, Pullets and Pen—W. S. Sullivan.

FRENCH CLASS.

Ancona—Ck.—2, F. A. Butterworth; 3, L. E. McLellan. Ckl.—1 and 2, Butterworth.

Mottled Ancona—Ck.—1, Willett Ware. Hen—1, Atkinson. Pullet—1 and 2, MacKay.

Houdans—Pen—1, Mrs. Emma F. Reid. Ck.—1, Reid. Ckl.—1, Reid. Hen—1, Reid. Pullet—1 and 2, Reid.

Faverolles—Ck.—1, Jack Lee. Hen—1 and 2, Lee. Pullet—1, Lee.

MISCELLANEOUS.

Silkies—Ck.—Henry A. Hoyt. Ckl.—1, Jack Lee; 2, Hoyt. Hen—1, Hoyt; 2, Lee. Pullet—1, Hoyt.

W. C. Black Polish.—Pen, Ck., Ckl., hen—1, Mrs. L. A. Robertson. Pullet—1 and 2, Robertson.

Guinea Fowl—Ck.—1, W. W. Hirsch. Hen—1 and 2, Hirsch.

Capons—Capon—1, Jack Lee; 2 and 3, P. S. Lay.

GAME CLASS.

Heney Muffs Pit Games—1, H. Harris.

Red Quills Pit Games—1, Harris.

Mt. Eagle Pit Games—1, Harris.

BANTAM CLASS.

Silver Sebright Bantams—Ck.—1, A. E. Eldridge. Ckl.—1, Jack Lee. Hen—1 and 2, Lee; 3, Eldridge. Pullets—1 and 2, Lee.

R. C. White Bantams—Ck.—1, Henry A. Hoyt. Hen—1, Hoyt.

Buff Cochin Bantams—Pen—1, W. W. Hirsch. Ck.—1 and 2, Ben M. Woodhull; 3, H. A. Hoyt. Ckl.—1, Hoyt; 2, Hirsch. Hen—1 and 2, Woodhull; 3, Hoyt. Pullet—1, Hoyt.

White Cochin Bantams.—Ck., Ckl., Hen, Pullet—1, Hoyt.

Partridge Cochin Bantams—Ck., Ckl., Hen, Pullet—1, Hoyt.

Black Cochin Bantams—Ck.—1, Hoyt; 2 and 3, Hirsch. Ckl.—1, Hoyt. Hen—1 and 2, Hirsch; 3, Hoyt. Pullet—1, Hoyt; 2 and 3, Hirsch.

Light Brahma Bantams—Ck.—1, Hoyt; 2, Hirsch. Hen—1, Hoyt; 2, Hirsch.

Golden Sebright Bantams—Ckl., Hen, Pullet—1, Hoyt.

WATER FOWL.

Brown China Geese—Old Goose—1, Wm. W. Hirsch. Old Gander—Hirsch.

White China Geese.—Old Gander—1 and 2, Hirsch. Young gander—1 and 2, Hirsch. Old Goose—1 and 2, Hirsch. Young Goose—1 and 2, Hirsch.

Grey African Geese—Old Gander—1 and 2, Hirsch. Young Gander—1, Hirsch. Old Goose—1 and 2, Hirsch. Young Goose—1 and 2, Hirsch.

Toulouse Geese—Old Gander—1 and 2, Hirsch. Young Gander—1 and 2, Hirsch. Old Goose—1 and 2, Hirsch. Young Goose—1 and 2, Hirsch.

Embden Geese—Old Gander—1, Hirsch. Old Goose—1, Hirsch.

Pekin Ducks—Old Drake—1, 2 and 3, Hirsch. Young Drake—1, 2 and 3, Hirsch. Old Duck—1, 2 and 3, Hirsch. Young Duck—1, 2 and 3, Hirsch.

SIMPLE TREATMENT FOR EARLY SYMPTOMS.

While I hold that it is not profitable to resort to much poultry doctoring, inasmuch as if the fowls are apparently cured, they are unreliable as breeding-stock, yet the giving of prompt treatment in the early stages of diseases is a wise act, says a writer in the Farm World.

Reviewing the more common ailments in the poultry yard we learn these facts:

If in the early stages of bumblefoot, we can spread the corn by painting liberally with tincture of iodine, daily, for a week, it is the thing to do. Bumblefoot is caused by having too high perches or roosting places. In flying down, the fowls' feet often come in contact with some hard, sharp object, which causes a bruise, resulting in the corn.

When hens are allowed to become overfat, a disorder of the oviduct is often the result which causes it to break down behind. It really is no disease—merely a penalty for injudicious feeding. The best remedy known is to kill and eat all specimens. They are not sick birds.

Canker is a digusting ailment, but generally in the start it can be checked by several applications of fine salt rubbed on the sore spots.

Four drops of aconite in a half pint of drinking water, given daily for a week or more, is effective in cases of catarrh.

Chicken-pox can be successfully treated by anointing the head and wattles with carbolated vaseline, after first having bathed well with hot water. A one-grain quinine pill should also be given each night for a week.

A one-grain quinine pill given each night for three nights, or the week, will work wonders in cases of colds.

Cases of costiveness can also be relieved by adding 10 drops of sulphate of magnesia to each pint of drinking water.

For enlarged or sour crop a half teaspoonful of baking soda to a quart of drinking water, added daily for a few days, is excellent. During the time of treatment feed sparingly. Cases of crop bound have been successfully treated by giving the birds all the warm coffee that can be forced into their crops. The dose should be repeated several times.

When a bird is debilitated, it needs something nourishing to build up the waste tissues. There is nothing better than a raw fresh egg every morning until the fowl shows signs of recovery, when it can be changed to a little cooked meat and a little nitrate of iron added to the drinking water. When it is noticed that the bird is mopish, but otherwise seems in good health, this sluggishness can be speedily remedied by giving a family liver pill—just the kind you would take yourself did you feel out of sorts. Repeat each night for three nights in succession. If possible, allow the bird free range over the grass plot during the daytime.

Slight cases of diarrhoea can be greatly benefited by adding a few drops of spirits of camphor to the drinking water. Also add finely ground charcoal to the soft feed.

Nothing better than linseed meal for indigestion. Give a gill in the soft feed to each dozen hens. A teaspoonful of fenugreek added to the mash for every ten fowls is also a good remedy.

A pill made from a half grain of quinine, one grain of sulphate of iron and five grains of phosphate of lime is just the thing for leg weakness. A more simple remedy is ten drops of tincture of nux vomica in a quart of drinking water.

A pill of asafoetida, about the size of a pea, given night and morning, is highly recommended for cases of limberneck.

When the fowl "rattles in the throat" there is evidence that there is some bronchial affection. This "rattling" will be more plainly noticed at night while the fowls are roosting. Give a teaspoonful every other morning of a mixture composed of equal parts of vinegar and water. If this is not effective, treat with a mixture of one part spirits of turpentine with four parts of sweet oil, giving ten drops daily.

There is no more effective remedy for scaly legs than to coat them with gas tar, allowing the preparation to remain on the legs until it wears off. The scales, as a rule, come off with the tar. To make a still more complete job of it, after the tar has worn off, wash the legs with warm water and carbolic soap, and after wiping dry, apply a preparation of one-third carbolic acid to two-thirds glycerine. The glycerine has a tendency to soften and bring out the color on the shanks and toes that may have become harsh and dry.

Catarrh is not roup. It is usually caused by dampness. Exposure to a drenching rain is a good starter for this disease. Roup is a purulent catarrhal affection of the air passages. Dr. Sanborn says it is a filth disease, and not caused by "taking cold." The difference between roup and catarrh is that the latter has a tendency to right itself without treatment, while the former seems to progress to a fatal end.

An English remedy for leg weakness is to give each chicken daily four grains of citrate of iron, or five or six grains of phosphate of lime put in the drinking water and given in pellets of meal. A good supply of nourishing food must also be offered, and it should be of a kind calculated to produce flesh and not fat—worms, ground bone or chopped meat being very acceptable. Plenty of fresh green food should also be given. Let the chickens have healthy exercise.

The man who allows his fowls to roost in trees and on the fences when the fall changes come is the one who complains of having sick hens. He finds some of them sniffling and sneezing, some with matter exuding from their nostrils, some standing around in places where they can find protection from the winds and enjoy the warmth of the sunshine. They will stand there humped up, with pale combs, showing every symptom of sickness.

The beginner often introduces roup to his flock by doing some foolish thing. For instance, he will close up the house tight at night, in winter, when the weather is cold, and allow it to remain closed all the next day. Naturally, a moisture is created, which generates a dampness, and the whole house will feel like a vault. The dampness which fills the house at night, and which usually comes from the fowls' breath, can easily be dispelled in the daytime by opening all the windows wide. Nothing will dispel dampness so quickly as the fresh air, especially if it be dry. It must also be remembered that fresh air never made a fowl sick; and it matters not how cold the outside temperature may be, it will benefit the fowls.

To secure best results, the scalding of poultry is something that must be done with the greatest care. Overscalding makes an unattractive carcass. The water should be just to the boiling point and not actually boiling when the birds are immersed. In doing this, it must not be forgotten, the operator must hold the bird by the legs and head and then lift up and down in the water three or four times, when all the feathers and pin feathers should be removed very cleanly without breaking the skin. All scalded poultry should be "plumped" after picking, by dipping for about two seconds in very hot water—just under the boiling point—and then thrown into cool water of the natural temperature, where it should be allowed to remain from fifteen to twenty minutes.

COLD STORAGE LAW.

Inquiry having come as to the present state law on storage of eggs and butter, we quote as follows from the enactment of the recent legislature:

Section I. For the purpose of this act the words "person, form, company or corporation" shall include wholesalers, retailers, jobbers, and every place where eggs or butter that have been in cold storage for a longer period than three months are sold or offered for sale.

Section II. Every person, firm, company or corporation, who sells or offers for sale any eggs or butter that have been in cold storage for a longer period than three months shall before so doing cause to be stamped, marked or branded upon all sides of each receptacle holding and containing the same in black-faced letters two inches in length the period of time during which the same have been in cold storage.

Section III. That every person, firm, company or corporation selling or offering for sale any cold storage eggs or butter, shall display in a conspicuous place in his or their salesroom, a sign bearing the words "Cold storage eggs or butter sold here" in black-faced letters not less than six inches in length, upon a white ground.

Section IV. Every person, firm, company or corporation, who shall fail to comply with any of the provisions of this act is guilty of a misdemeanor and punishable by imprisonment in the county jail for a term not exceeding six months, or a fine of $250, or both fine and imprisonment.

Section V. The state board of health is hereby authorized and directed to make rules and regulations necessary to carry this act into effect.

Bees and Their Care

REQUEENING AN APIARY.

By Albert Dodge, Pasadena.

Located as my apiaries are at the entrance of two canyons, each equally accessible to the foothill orange groves and to the sage in the canyons, I prefer to requeen as early as possible in the spring for three reasons:

1. I can stimulate the early raising of drones from selected queens and thus secure the fertilization of my queens by select drones only.

2. I can secure stronger colonies for the later honey flow, and can have developed my increase into strong colonies in time for them to take advantage of the late flow.

3. The manipulation incident to the requeening operations will, in a measure, control swarming by timing these manipulations so they just precede the early orange honey flow.

How Often to Requeen?

At least once in two years, and oftener when the queen proves undesirable. This means that every year we will want to raise new queens for at least one-half our colonies, and for all our increase. To this should be added at least ten per cent to supply colonies whose new queens are lost in mating or otherwise.

Select drones as well as queens. Be sure that the drones are from as good queens as the brood from which the young queens are reared. Also take care that the drones are not too closely related to the queens. This is avoided when we buy our breeding queen from another apiary. If we are not able to secure the mating of the young queens before drones are hatched in hives whose queens are not satisfactory for the purpose, the zinc excluder should cover the entrances of all such hives until after the young queens are properly mated.

How to Requeen.

From a careful survey of the season, I calculated that the orange honey flow where my bees are located will commence about the first to middle of April this year. I want to so plan my queen rearing that the new queen will hatch out about that time. I therefore have decided upon the following schedule, which I shall undertake to carry out. This schedule can be modified to suit the local conditions at the apiary sought to be requeened:

March 1—I have previously so manipulated that I have drone cells occupied with eggs or brood on this date, in only such hives as have good, pure-blooded queens of satisfactory strain. I did this by stimulating the queens that are to rear the drones to early laying and seeing that drone comb was in center of hive, then gradually taking other comb from the hive and putting drone comb in its place until the hive is filled with drone comb only, if necessary.

March 7—Select 20 per cent of my strongest colonies and place a story of empty combs on each, allowing the queen access to both stories of the hive. If necessary, I shall stimulate these colonies to early brood rearing by a system of light feeding.

March 17—Place queen excluder between the two stories of these hives with about three-fifths the brood above and two-fifths the brood and the queen below the excluder.

March 17 to 27—Gradually remove frames of brood from the breeding queen, substituting therefor empty combs. This will insure fresh young brood and eggs when needed for queen rearing.

March 27—Remove temporarily the brood chamber and the queen of the 20 per cent selected for breeding purposes to another stand, placing the upper story on another bottom board on the old stand. The brood in this new hive is now practically all capped, and the hive is hopelessly queenless. The old bees will return to it, thus making it very strong in bees. Place strips of comb containing eggs or very young larvae from the hive of the breeding queen, between the frames in these queenless colonies, destroying the contents of two or three connecting cells, that the new queen cells thus reared will not be too close together. Place these cells so they face up or down, thereby allowing plenty of room for the building of large queen cells. The bees will accept a large portion of these cells and raise large, beautiful queen cells, because they are now aware that they are queenless, and instinctively proceed to raise another queen.

March 28—Place another story with empty combs on each of the remaining hives in the apiary (and, if needed to secure more queens, place another story on top), in each of which will be placed a quantity of brood, so each of the upper stories of the hive will contain about two times as much brood as will the lower story. Place queen excluder on the hive, leaving the queen in the lower story.

March 29—Return the original hive which was placed on a new stand on March 27th to the old stand, placing the other hive on top with queen excluder between. Queen below and queen cells above. The bees will continue to complete the queen cells they have already accepted.

March 30 or 31—If the bees have not built as many queen cells as desired, now is the time to rear more, by again placing the chambers containing the queen on the new stand, and the upper story on a bottom board on the old stand, as before. Place the queen cells already accepted over an excluder in another colony to be capped. Introduce new eggs or very young larvae from the breeding queen, the same as before, and thus secure an additional supply of queen cells.

April 6, or ten days after placing the eggs or larvae in the breeding hives, these queen cells should be distributed by placing one or more in each super prepared for them by having placed therein frames of brood over an excluder. The cells should be placed in queen-cell protectors to hatch.

To rear my 400 queens I expect to make my hives each three stories high, placing brood in each of the two upper stories on March 28, with queen excluder between the hive and the first super, confining the queen below the excluder. In each of these supers I place one or more queen cells; on

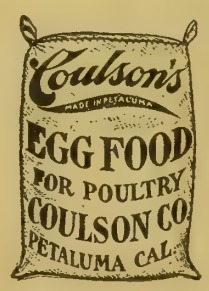
(Continued on Page 138.)

YOU BE THE JUDGE

Give Our Food a Fair Trial--

Then Decide Whether It Is Worth While

We buy in large quantities, sell on a close margin, and give the poultryman more for his money than he can secure from any other source.



No individual poultryman, or association of poultrymen ever put into food so many elements that are essential to the success of his birds, as are found in COULSON'S EGG FOOD.

You can use our food from one year's end to the other; you can feed a certain kind to little chicks, another kind to laying hens, another kind to the general flock. In each case the particular need will be fully met.

Our food is not an experiment. We have been manufacturing it for a number of years, and each season has seen a greater number of names on our sales book.

You can get the best if you will but ask for it, and refuse cheap substitutes, on which the dealer makes more and you make less.

Our food is for sale by all reliable poultry supply houses.

Send for helpful books. Mailed free.

Coulson Poultry and Stock Food Company

Questions and Answers

THE EDITOR AND STAFF

Water Near Surface.

We are situated in the valley of the Colorado river and the land is underlaid with sand at a depth from surface of two to six feet, the sand being filled with water from the river which rises in May, June and July when the river is high to nearly the surface, and on the lower levels to the surface. In the winter months the water is never over four to six feet from surface. The top soil being in some places a heavy adobe soil and in others sandy with quite a little white alkali or salt mixed with it. Are there any crops suitable for it? Would pears do well on this wet land, or apples? How about grapes? Where the water stays four feet from surface we have alfalfa growing this year which is doing remarkably well but will it stand the moisture when the roots get lower? We have been afraid to plant alfalfa where the water is nearer than two feet from surface. We practice irrigation here under the U. S. reclamation act and irrigate by flooding as in the Imperial Valley.—A. H. J., Bard, Imperial County.

If the condition is such as you mention, we believe the best way would be to cut drainage ditches through the place and remove surplus water by pumping. We take it that during the three good growing months the water rises to the surface. Of course alfalfa will not stand for this but a short time. Under such conditions we have known of the drainage ditches with large pumping plant to turn the water back into the river, making the land most productive. Excepting a very few water loving plants, we do not believe such conditions will produce profitable crops. The Government has made experiments on many varieties of rice which might be found to be very profitable under the conditions mentioned by the subscriber. For the fruits mentioned the conditions are not ideal and we would question the advisability of planting unless drainage is provided for. Many vineyards of Fresno County died when the surface water of irrigation ditches came to the surface. We will ask our subscribers who have had similar experience to aid the inquirer.

Keeping Onions.

How can I keep over onions for the winter sale?—Subscriber, Escondido. Also asking the same question, subscriber at Orland, wants to know how to keep onions until Spring or how long will they keep?

The keeping will depend upon weather conditions and upon care in gathering and storing. Be sure that they are thoroughly dried by leaving on the ground after digging, being careful to cover with weeds or lightly with straw to prevent sunburn where the weather is especially warm. Be sure and cut off tops at once. After drying, put in trays or shallow boxes, surely not over 6 inches deep—4 or 5 is better. Provide for perfect circulation of air around and through them. Keep in as cool and airy a place as possible. If brown Australians or a good yellow onion is treated this way it will perhaps keep until the higher prices of December and January. It must be borne in mind that there will be some shrinkage, and one grower has said that if he could secure 1½ cents now he would sell rather than hold for 3 cents in the winter. Another has said, however, that he does not consider the shrinkage would be very serious if a cool storage place could be had.

Black-cap Raspberry Pruning.

Please inform me when is the best time of the year to prune black-cap raspberries.—R. L. C., El Monte.

Of course the first feature in pruning raspberry vines is the removal of the old canes as soon as the fruit is off. The best tool for the work is probably the long pruner used in topping fruit trees. Pinching back of the growing tender shoots is the best method of handling the stalks which will carry next season's fruit. Some begin pinching them back near the ground so as to make them send out more lateral canes. Where the ground is rich and there is plenty of moisture this topping must be followed or long, wide growth is produced with but little fruit bearing vines. Where the cutting out of the old canes is done quickly after the crop removal vines will usually throw a fall crop. These same canes will then bear the following spring.

Questions of a Town Lotter.

What do you think of the Black Langshans and the Buff Orpingtons for a city lot? Would you keep two breeds (separately, of course) and with which of the above? Does it pay to trap-nest hens? And how many nests must be provided and how often must they be visited? How many square feet of roosting space must be provided for a hen? Do hens get sufficient exercise if made to scratch in the dust for grain or should a scratch-pen of straw be provided and how do you make it? How do you thoroughly disinfect a used run?—Subscriber.

The Langshans are a splendid fowl for a city lot. I have kept them myself and speak from experience. They lay a very large egg and of the deepest brown color of shell, a beautiful egg; are good layers and of a splendid disposition. The only possible fault that can be found with them is that the color of their skin is like that of a turkey. The Buff Orpington cannot be beaten as an egg layer. They commence early and keep it up the year round. They are a very fine table fowl and the only fault that any one can find with them is that they want to sit too often, but that tendency is being bred out of them. I would not keep two breeds on a town lot. I think that it pays to have trap nests for any one who wants to know what hens are paying for their keep and what hens to breed from so as to improve the breed. I find that one nest for every three hens is sufficient. I keep three nests in each pen of eight or ten hens. The nests are only visited at feeding time in the morning, at about ten o'clock and at noon when the green food is fed, and again at the evening meal.

About four square feet of roosting space is best. Hens should have a scratch pen of straw, because they do not get exercise enough in only scratching in dust. It is different from hens on the range, there they dig for worms or grubs and the drier the weather the deeper they have to dig, but with grain only scattered and slightly forked under they get it too easily and almost without exercise, whereas with deep straw they have to scratch constantly and for every grain they find they bury two, also they eat a great deal of the straw which is an economy in the food. The best way to disinfect the runs is by planting a crop of wheat in them.—Mrs. A. B.

Correction.

A subscriber at Santa Ana recently gave cure for roup, canker and chickenpox in which she said: "I dipped their heads in a solution of one pint of warm water and a teaspoonful of permanganate of potash, holding under while I counted ten, and it cured all of them in a few days, except one that was too weak to stand when I tackled him." She now writes: "I am sorry that I omitted to say that after making the solution of one teaspoonful of permanganate of potash to one pint of water, I used two tablespoonsful of this to one pint of warm water for dip, as first solution would be too strong. I was only trying to help some one and hope that I haven't hindered any one by the mistake."

A DIAGNOSIS.

When you're feeling all run down,
  When your sight is somewhat blurred,
When your taste is rather brown,
  And you hear no cheering word;
When you get to wondering
  If there's joy behind the skies,
It is likely that the thing
  That you need is exercise.

After you've made up your mind
  That you do not get your due,
When you think the world's inclined
  To bear down too hard on you,
It's a sign that you should rise
  From the chair in which you sit
And through manly exercise
  Gain a new supply of grit.

S. E. Kiser.

On the next *Studebaker* Wagon you pass on the road

Why aren't they split and cracked like the ordinary wagon?

Because the ordinary wagon hub is made from oak, a wood that splits and cracks very easily, while

Studebaker **WAGON**

hubs are made from *Eastern black birch*, a very springy, tough wood, chemically treated, with great weather resisting qualities.

Western birch is used by some manufacturers, but it is even poorer than oak. It is *brashy* and will not stand the strain.

Studebaker hubs cost more than any other hub on the market, but they are stronger and wear longer.

Another reason why you should buy a *Studebaker* from

Newell Mathews Co.

COOL WATER IN THE HOT SUN
"NO MR SUN"
YOU CAN'T WARM THE WATER IN THE APPELL WATER BAG"
TRADE APPELL MARK
SOUTH AFRICAN WATER BAG
THE ADAM APPELL CO. PORTLAND OREGON

APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

IMPERIAL GUARANTEED AUTOMOBILES.

Model 44

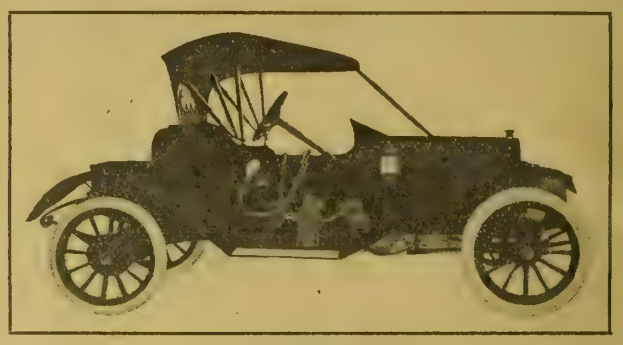
Imperial Models for 1912

Our motto has been "The Get There Kind," and the 1909 and 1910 and 1911 lines of Imperial Cars have become so famous for quiet and beautiful operation, remarkable flexibility and superb hill climbing capacity, that we feel proud to introduce to you our innovations for 1912. Model 43, a snappy and racy looking gentleman's roadster, shown below, without a peer on the market; Model 44, above, our semi-torpedo, five-passenger, fore door touring car, with its graceful and beautiful lines to recommend it to any connoisseur. No expense, time or effort has been spared to produce a highly artistic, practical and refined product. Going beyond outside appearances, Imperial power plants are free from superfluous parts—are capable not only of developing power smoothly, easily and without strain, but with reciprocating parts utilizing every ounce of power when the maximum is needed.

Absolutely Guaranteed

Arnott & Company have taken on the Imperial line as a permanent addition to their other high grade agencies. The high standing of this company attained during the last eighteen years is guarantee that these cars are right in every way. We have eight sample cars on xhibition and solicit the most rigid examination, especially from buyers who are now purchasing their second car and who will recognize the high grade of the "Imperial."

We want an energetic owner-driver agent for this line in each community and can offer a most liberal agency contract that will justify giving us your entire time in selling these cars at a handsome profit. Write today for catalogue and if you are in position to act as agent let us know.



Model 43

ARNOTT QUALITY GUARANTEED — ARNOTT & CO. INC. 112-118 So. LOS ANGELES ST., LOS ANGELES, CALIF. — ARNOTT QUALITY GUARANTEED

REQUEENING AN APIARY.

(Continued from Page 136.)

April 6 the top super with the bees therein I will then place on a new stand for increase. The queen will hatch and commence laying in the new hive in the regular way. The new colony will be weak at first, but it will soon gain strength, and hatching brood can be given it from other colonies.

The lower super I will place on a bottom board, giving it a cover, thereby making a hive of it, placing it by the side of the old hive, because it is later to be united with the old hive. After this new queen commences to lay, the new hive will be placed on top of the old one with a queen excluder between them, or, if the old queen is removed, it will be substituted for the brood chamber of the old hive, distributing the surplus brood in the supers or with weak colonies.

April 15 to 20 the new queens will probably all be laying. Some queens will probably be lost while mating For the purpose of meeting a contingency like this, 10 per cent surplus queens were hatched. These will probably be in supers which were over old queens we do not care to supercede at this time. They can be drawn upon to replace any lost queens. If at the end of the season we find we still have a surplus of queens, we can make our selection and remove the most undesirable queens, whether old or young.

To avoid swarming which we do not desire, in as much as we provide our increase in another way, we take care that the bees have suitable ventilation and plenty of room in both super and brood chamber. On March 28 we placed some frames with brood above the queen excluder and filled their places with empty combs in the brood chamber. This gives the queen room for brood and as the bees hatch out of the frames above the excluder, it leaves storage room for honey.

Coachella valley, Riverside county, has a thresher at work on alfalfa seed.

DEMAND FOR HONEY.

Secretary A. B. Shaffner of the State Bee Keepers Association writes that he has received a letter from a European firm inquiring for a large quantity of beeswax, also that a London house is making inquiry as to light amber honey in car lots. We doubt not the hot weather that prevailed over the East a few weeks ago burned up all the white clover honey, and imagine that California's honey crop this year will find keen demand at long prices.

APPLE SEEDLINGS IN THE NORTHWEST.

(Continued from Page 123.)

will pay for all the extra trouble and expense of growing seedlings in the West.

Now my experience in the work has taught me that first I must have first-class seed, the best in my experience being the French crab seed, then get it as early as possible. I have mine shipped from New York by express. When it arrives I soak it for a couple of days, then pack in ice and leave till I am ready to plant. I plant in rows thirty inches apart, about twenty seeds to the foot, and about one inch deep, then throw a ridge three or four inches high above them, and when they germinate and are ready to come through the ground, I rake off the ridge to let them come through easily. As soon as they are through the ground, I allow them to make all the growth possible so that I get all my growth early and let them have plenty of time to mature and harden the wood before fall.

I consider the principal things necessary to make a success of the growing of apple and pear seedlings:

1. Proper care in preparing your seed.

2. Proper care in helping them through the ground.

3. Forcing all the growth possible early and letting them mature early.

In conclusion, I would say that while we may have made many failures in the growing of seedlings, still the game is well worth the candle, and I hope to live to see the day that we will be shipping them to the Eastern states to get back some of the money we have sent east for seedlings in the past.

THE MODERN WAY OF DOING THINGS ON THE FARM.

Modern implements and up-to-date business methods are now to the fore in the daily life of the progressive American farmer. Automobiles carry him from farm to farm, and from one section of his farm to another. Traction engines do the heavy farm work, and the business of the farm is carried on in a modern manner, often with the help of sons and daughters who are graduates of present-day business schools.

That old bugaboo of the farmer—the leaky roof—is gone. He realizes that a good tight roof is not only necessary for comfort and healthfulness, but it adds to the value of his property. In the old days, because there was nothing better, the farmer had to "put up with" the shingle roof, which rotted and warped and leaked; or the tin roof, which rusted and had to be painted every so often; and the expensive slate roof, which was apt to crack and blow away, piece by piece. Then the houses were damp, and it was frequently necessary to place buckets around to catch the drippings every time it rained. Outbuildings were rarely ever covered with a water-tight roof, and the animals showed the effects of unsanitary surroundings.

Today the up-to-date farmer uses Genasco—the Trinidad Lake asphalt roofing made by the Barber Asphalt Company, of Philadelphia. This ever-lasting natural waterproofer makes his roof secure against all kinds of weather, and is so easy to apply that any farmer can lay it himself. The attractive booklet, "The Good Roof Guide Book," issued gratuitously by this company, gives much valuable information concerning roofing in general. This kind of help is one illustration of why the modern farmer has been able to progress so far ahead of his ancestors.

320-ACRE HOMESTEAD.

With the new regulations permitting the homesteading of 320 acres instead of 160 in dry farming sections, an impetus has been given to dry farming which could not have been done otherwise. It is admitted that the dry farmer is handicapped when compared with the irrigation farmer, but at the same time the possibilities of home-making under dry farming operations have been proven in many sections of what has heretofore been called the arid West. Where a reasonable rainfall can be depended upon and the farmer is willing to use intelligent dry farming methods, he has almost invariably made money. In fact, we believe intelligent dry farming with scant rainfall is to be preferred to slipshod methods with abundance of moisture. Dry farming puts one on his mettle and is reasonably sure to bring success. Mr. J. G. Bates of 305 Severance Building, Los Angeles, is handling some dry farming propositions with homestead possibilities in Utah. A letter to him will bring information as to what he has to offer. The last issue of the Arrowhead refers to certain grain lands similar to those which Mr. Bates is handling, as follows:

"The high lands, those above 3500 feet altitude, produce all kinds of small grains and hardy vegetables, and excellent crops of apples and small fruits. Dry land farming is being successfully pursued on some of the high lands, and the State Experiment Dry Farm at Enterprise has a yield of 33½ bushels of wheat per acre to its credit. The towns situated on the high lands are Enterprise, Pine Valley, New Harmony, Pinto, and a new settlement named Central."

MECHANICAL IRRIGATION.

The International Harvester Company of America, with offices at Chicago, is mailing a booklet on mechanical irrigation, filled with illustrations of modern irrigating plants as well as those of old Egypt and of early Greece. In addition there is a fund of information on water measurement, friction of water in pipe, irrigation quantity tables, etc. It is well worth the writing for, and we think The Cultivator is mentioned it will be sent without cost.

NORWICH AUTOMATIC EXERCISER AND FEEDER FOR CHICKENS

POULTRY

Lasher's Hatchery, 15 Kent St., Petaluma, Cal.—Why my chicks live and grow in the hands of my customers: They are all hatched from free range stock, bred right, mated right, fed right. I have the most up-to-date hatchery building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks; 16 years in the hatching business, 10 years at present stand. It is no experiment or guesswork with me. Am now booking orders for August and later delivery. On account of time and room, will sell all of my Belgian Hares, 200 breeders, young and old. Write for prices on just what you want.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Our Red chicks are hatching strong, only $12 per 100. Do you want Ancona chicks at $15 per 100 or 18c each? How about yearling males at $3 for Leghorns and Anconas; $5 to $7 for R. I. Reds and Buff Orpingtons? Eighteen Leghorn hens and cock for $20; R. I. Red young cock and four hens, $12; Buff Orpington young cock and four hens, $14. Write for our summer price list. Goodacre Bros., Compton, Cal.

S. C. White Leghorn Cockerels, 3 months old, from roosters of F. Baldwin, San Jose, and one of the best flocks of White Leghorn hens in Petaluma. If taken before Sept. 1, $1.50 each or $12 per dozen; after Sept. 1, $2 each or $18 per dozen. Also Buff Orpington cockerels, $1 each. L. T. Smith, Beaumont, Cal.

Standard Poultry Yards have the thoroughbred Crystal White Orpington Eggs for hatching, in incubator lots or single settings (from the Cook or Kellerstrass strain). Baby chicks from the same strain from one day to one month old for sale. Prices quoted upon application. E. C. Worden & Son, Props., 4004 University Blvd., San Diego, Cal.

For Sale—2,000 pullets of all kinds, every week. This week especially we will have 150 Barred Rocks, very fine stock, largely Espe strain, from three months to seven months old. Price 50c, $1 and $1.50. 1,000 White Leghorn hens on hand all the time. Send for catalogue. P. Cook's Mammoth Hatchery, 3017 S. Main St., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Place your order for fall cockerels. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Day-Old Chicks, Barred Rock and White Leghorns, good laying strain. Order now to insure early fall delivery. The Fairmount Hatchery, 29 B Rural No. 1, Santa Cruz, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Orpingtons—High class Buff and White. Bred to lay from prize winning stock. 500 pullets and cockerels for sale. Reasonable prices. Will mate pens with unrelated males. Write Mrs. S. Swaysgood, Route 1, Healdsburg, Cal.

White Leghorns—Buff Orpingtons. Bred for beauty and great egg production. Grand lot of both old and young stock for sale. Prices reasonable. Write your wants. Model Poultry Farm, Box H, Irvington, Cal.

Rose Comb R. I. Reds—A few fine breeding cocks for sale at bargain to make room. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Hicks Jubilee Hatchery, now booking orders. Write us your wants. We use eggs from first-class stock only. Try us. W. J. Hicks, Petaluma, Cal.

The Luedkes—Incomparable R. I. Red, high record layers—now booking orders for eggs for fall delivery. P. O., Anaheim, Cal., Route 1.

Rose Comb Black Minorcas, nine years line bred. Stock and eggs in season. Eleanore Minorca Farm, R. D. 1, Los Angeles, Cal.

Good Barred Rock Cockerels, $1 and up, according to age and quality. G. L. Hawley, Madera, Cal.

DUCKS

For Sale—Mammoth Pekin Duck Eggs, 75c per 12; $5 per 100. Special offer in breeders to make room for young stock; $4 per trio; pens of 6 or more, $1 each for ducks, $1.50 for drakes. A. E. Nelson, El Monte, Cal.

White Indian Runner, Fawn Indian Runner, Aylesbury and Buff Orpington Ducks, stock and eggs. Catalog free. Caldwell Bros., Los Angeles, Cal.

Splendid Mammoth Pekin Breeding Ducks $1, drakes $1.50, trios $3. Mrs. Guerard, Merced, Cal.

Ducks Wanted—Highest market prices paid Submit list and cash price. C. L. Barnett. 516 Phelan Bldg., San Francisco, Cal.

TREES

Orange, Lemon and Grape Fruit Trees, all first class stock. Special prices to parties planting groves. Fresh avocado seeds for August delivery, $2.75 per 100. Also strong Florida sour seed bed stock. Edward A. Carvel, 1454 Oak St., Glendale, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal

Fine line of Navels—Valencias and Eureka lemons for delivery spring of 1911. Contract now and get the first choice. The King Citrus Nurseries, Whittier, Cal.

MACHINERY

For Sale—Second-hand windmills, gasoline engines, wagons, buggies, harness, disc, gang, walking, riding and side hill plows; slip, Fresno and wheel scrapers; headers, ballers, seed sowers, spike tooth and disc harrow, mowers, fanning mill, dry washer, disc cultivator, reaper, eveners; road grader, road roller, Hurst two-horse sprayer, mining hoist, sundries

WINDMILL OUTFITS.
8-ft. Aermotor, tower, pump, 3,000-gal. tank, $59 f. o. b.; 13-ft. Aermotor, pumping and power mill, cost new $120, for $60; 12-ft. Aermotor, tower, 10,000-gal. tank, tank stand, 100 ft. 3-inch pipe in well, rods and cylinder; $150 for this large irrigation outfit.

ENGINES.
2½ H. P. Lambert engine complete with pump jack for $72.50, fine shape; 4 H. P. Stearns in fine shape, fine pump jack, 100 ft. 4-inch pipe and draw valve cylinder, $160; 6 H. P. Fairbanks, 25 H. P. engine and hoist, brand new, cost $1,300, for $600; 25 H. P. Foos, guaranteed first class, $390; deep well double acting Ames jack, 180 ft. 8-inch casing, 180 ft. double rods, 7-inch double acting Ames draw valve cylinder, complete, $250.

TANKS, TANKS, TANKS.
50 gallons to 50,000. Several large redwood tanks, fine for storage, domestic or irrigating, 10,000, 12,000, 25,000, 35,000. Why buy new when we save you half and guarantee material?

TYPEWRITERS.
$100 Visible Oliver Typewriter, $24; nearly brand new Smith Premier with $20 tabulator, $27.50; fine new Century for $19, guaranteed good shape.

Demmitt Company, 120 N. Main St., Los Angeles, Cal.

For Sale—Motors, gas engines, pumps and all accessories for pumping plant, new and second-hand. Call or write. Baillie & Brandt Co., 943 N. Main St., Los Angeles, Cal.

For Sale—10 H. P. "Jewel" horizontal steam engine, second-hand, good working order, $75. Baillie & Brandt Co., 943 N. Main St., Los Angeles, Cal.

For Sale—Cheap cast iron top circular saw table with 12 saws, almost new. Write or call Baillie & Brandt Co., 943 N. Main St., Los Angeles, Cal.

MISCELLANEOUS

Free—"Investing for Profit" Magazine. Send me your name and I will mail you this magazine absolutely free. Before you invest a dollar anywhere get this magazine—it is worth $10 a copy to any man who intends to invest $5 or more per month. Tells how $1,000 can grow to $22,000; how to judge different classes of investments, the real power of your money. This magazine for six months free if you write today. H. L. Barber, Publisher, R. 430, 28 W. Jackson Boulevard, Chicago, Ill.

For Sale—The Patented Right to manufacture and sell a heat and smudge fuel for frost prevention in orchards and gardens. Better by 50 per cent and cheaper by 75 per cent than any other on the market. No reservoirs needed, no wagon tanks, no pots, no storage houses. Big money maker. For particulars address Otto Anderson, 800 W. 47th St., Los Angeles, Cal.

Send 25c for our latest Bungalow Book, showing scores of beautiful California homes with plans as we build them—direct from Bungalow Land. Home Seekers' Bldg. Corp., 722 Higgins Bldg., Los Angeles, Cal.

FOR EXCHANGE

For Exchange—An improved dairy ranch of 160 acres, 50 acres in alfalfa, balance in grain, could easily be planted to alfalfa, as the land is level, with free water for irrigation. Good seven-room house, good barn, cow sheds, windmill, all fenced, situated near railroad and creamery. $125 per acre; would accept some clear property in part pay. Would pay to investigate. Owners, Box 440, Tulare, Cal.

POULTRY SPECIALITIES.

Special Incubator Offer—We are overstocked on 130-egg size Success Incubators. We offer 50 of them at $10 each as long as they last; regular price $14. Order now. E. E. McClanahan Incubator Co., 112 East 8th St., Los Angeles, Cal

THE EARLY WORM.

A father had been lecturing his young hopeful upon the evils of staying out late at night and getting up late in the morning. "You will never amount to anything," he continued, "unless you turn over a new leaf. Remember that the early bird catches the worm."

"How about the worm, father?" inquired the young man. "Wasn't he rather foolish to get up so early?"

"My son," said the father solemnly, "that worm hadn't been to bed all night; he was on his way home."—Ideas.

I COULDN'T STOP.

Years ago, when there were only wooden sidewalks in the city of Winnipeg, Canada, holes were bored in the planks to let the water run through. In the morning twilight a policeman found a man with the tip of his wooden leg in one of these holes and hurriedly walking around it.

"What are ye doin' here?" asked the policeman.

"G'way, offsher," said the man. "Got to get home before ol' lady wakes up."

IN THE SHADOW OF THE NOOSE.

He was an observant little chap. "Pa," he said, "Uncle Joe is going to be married Friday, isn't he?"

"Yes, son. Uncle Joe has only three more days to wait."

The little boy sighed. "The last three days," he said, "they give them everything to eat they ask for, don't they, pa?"—Everybody's.

SECURITY BUILDING
Ground floor and Basement occupied by the Security Savings Bank and Safe Deposit Vaults.

SECURITY SAVINGS BANK

Spring and Fifth Sts. Los Angeles, Cal.

OLDEST AND LARGEST IN THE SOUTHWEST

Capital and Reserve $2,000,000.00

Resources - - - $32,500,000.00

More than 64,300 Open Accounts

4% Interest on Savings Accounts
And on Six Month's Certificates of Deposit

3% On Special (Ordinary) Savings Accounts
Which Accounts may be checked against without presentation of Pass Book. Interest is paid monthly on the minimum monthly balances provided it amounts to $300 or over.

The Safe Deposit and Storage Department is the largest and best equipped in the West

Polytechnic College of Engineering

A College of Practical Engineering

13th and Madison Sts., Oakland, Cal.
Incorporated (Capital $100,000)

The only school in the West thoroughly and completely equipped for real, practical engineering work, where actual contracts are executed and construction work performed by students. All non-essentials eliminated, all essentials emphasized. Gives an opportunity to specialize, combining practice with theory. (Grants degrees).

THE PERFECT WAY.

Meet sorrow with bright face, and wear a smile
When trouble comes; and lo, upon your brow
The thorns shall into roses grow ere while—
The thorns, O friend, the thorns so bitter now
Will cease to be a trial
If you but wear upon your face a smile!

Drink deep of truth and let the fountain play
Within your soul; there is so much delight
To answer you with joy in bough and spray,
So much of beauty in the day and night—
Ne'er can your heart turn gray
If in your breast you give the spirit play!

Shut thou the door on fear and let hope in!
Out of the radiance of the earth and skies
Garments of glory and of grandeur spin
White as the lilied hosts of paradise—
You shut out death and sin
And ope the door to life when hope comes in!

—Edward Wilbur Mason, in National Magazine for July.

IT'S A SECRET.

Marion opened the front door about an inch and beckoned Isabel with a forefinger tingling with mystery.

"Isabel," she whispered in a tone that was easily heard across the street, "come on in. I've got something to show you."

"It's upstairs in my room," she whispered hissingly.

The two clambered up the stairs.

"There don't a soul know a thing about it but me," whispered Marion.

"Oh, ain't it lovely!" gasped Isabel.

They bumped on up the stairs. Then Marion led the way into her own little chamber and closed the door mysteriously.

"Cross your heart, hope you may die, if you ever tell!" She fixed Isabel with a solemn gaze.

"Oh, Marion, there won't never anything make me tell," she declared, clasping her little hands in a transport of joy. Then her face fell. "Of course, unless mother asks me about it," she added. It was a very wistful but dutiful pair of eyes that looked into Marion's.

Marion hesitated. "Well, of course, I mean everybody 'cept your mother, and not her unless she asks you. It ain't anything she'd care about your knowing. It's just that I want to s'prise people."

She dived under the bed and drew out a box. Then she seated herself in her little armchair and Isabel squatted in front of her in rapt admiration.

"You wouldn't ever guess, Is'bel," went on Marion, condescendingly, after a moment, during which Isabel watched her with bated breath, "'cause you're so kind of stupid, so I'll have to tell you.

"Wouldn't you be just s'prised to pieces ,Is'bel, if I should tell you I was writin' a book?"

Isabel nodded, shutting her mouth for a moment as though to swallow this exciting information. "Oh," she said, "a book!" Then she opened her mouth again.

"Yes," said Marion, busily unfolding papers and spreading them out on her lap. "A pink book, or maybe a blue one! I haven't decided which yet. With the picture of a lovely lady on it! And I'm going to read it to you!"

Isabel's sigh was replete with adulation.

"It isn't finished yet," Marion went on, "but I'll read what I've written." She cleared her throat majestically and began:

"'Once upon a time there was a little boy and his mother made him a blue cap to wear.'"

Isabel gave a chirp, delighted to find something familiar in this high pressure, artistic atmosphere. "Just like Red Riding Hood," she squealed.

Marion frowned. "No, it ain't a bit like Red Riding Hood," she said severely. "Red Riding Hood was a girl and she had a red hood, and this is a boy and he has a blue cap, and if you interrupt, Isabel, I won't read you another word."

Isabel dropped her prety head, disheartened by her failure properly to appreciate the intellectual feast.

"Oh," she said, dismally, "I didn't mean to make you mad, Marion."

"I'm not mad," returned Marion, magnanimously. "But when I get to thinking it makes me nervous if people talk to me. Well, I'll read you the rest: 'One day this little boy's mother gave him a little box and it had in it some cookies and some candy and some bananas.' You see, Is'bel, it isn't really a bit like Red Riding Hood, because she had a basket with pats of butter in it. 'Then his mother said to the little boy, "Now you take this box to your Uncle Jack, who lives all by himself in the woods, and you give it to him, and give him my love." So the little boy when he came to the cottage in the woods went up and knocked at the door.'"

"I should think he wouldn't 'a' had to knock at the door when it was his own uncle." In her interest Isabel forgot instructions and, unsolicited, assumed the thankless role of critic, for which she was promptly rebuked by a withering glance.

"'He went up and knocked at the door,'" resumed Marion, disdaining to call attention by words to this lapse on Isabel's part, "'because he was a polite little boy and always knocked at the door, whether people were his own uncle or not. And so he went inside and there were three chairs sitting in the parlor.'"

Isabel, carried away with excitement, forgot all caution and clapped her hands delightedly. "It's the Three Bears!" she cried joyously.

In an instant her happiness was dispelled. Marion very deliberately laid the papers down on her lap, smoothed them out and then returned them to the box.

"You're not very polite," she said in a well modulated voice, "when you tell people their stories are like other stories, when they're not a bit, especially when people have asked you not to talk while they're reading to you; so I guess I won't read to you any more."

After a moment's silence a gentle little sob made her look up in time to see a big tear roll down Isabel's peachy cheek. Marion leaned over gave her a forgiving pat.

"Don't cry, Is'bel," she cooed. "You know you can't help being stupid. And, besides," she added, generously "there isn't any more now, anyway. I didn't have the right kind of paper to finish it on, so I had to quit."—New London Record.

THE DECORATING OF WALLS.

A well-planned room can be as much overdressed as a person, and as the fashion magazines have brought the latter to our attention most favorably by comparing good and bad taste, so we are, too, illustrating the great change produced in the same room by the treating of its wall surfaces in good and bad form.

The artist and decorator have often found that an added bit of color or another line introduced will destroy harmony, rhythm and restfulness of the work. It is often most difficult for the amateur to determine the point at which the decoration should cease. The writer was consulted regarding the framing of a Venetian water scene, for the perplexed owner said: "I've tried hanging the picture in every part of living room and library and it just doesn't appear right in that frame, authough the shop declared it was correctly framed." And it was. A deep 3-inch mahogany frame without any mat brought out the rich blues, greens, warm reds and buffs. The scene could hardly be framed better. What, then, was the trouble? Inquiries developed the fact that the walls of both living room and library were covered with a highly figured wallpaper of a poppy design in green and yellow on a gray blue ground, the poppies all as large as cabbages and the design showing a pronounced wavelike pattern. One's eye jumped from one poppy to another and was forced unwillingly to follow the arrangement of pattern. The Venetian scene and a few other well-chosen pictures were simply spots of indistinct color on the wall, spoiling the movement of the design and hiding a portion of a poppy that we were just dying to see. It is hardly necessary to say that the background and not the framing destroyed the beauty of the harmonious bit of landscape. How could the eye rest quietly upon the picture and enjoy its bit of nature when the background was so disturbing and prominent? A plain green paper formed a good background for the picture and allowed the owner to view his treasure in peace.

But if no pictures are to be hung in a room isn't a figured covering necessary? Will not the wall appear bare? These and other questions will perhaps arise. A figured paper can be used with good effect if the wall spaces are large and uninteresting and no pictures are to be used; but, on the other hand, the monotonous effect of the oft-recurring pattern is far more disagreeable than the plain surface. A highly colored but well designed frieze can be arranged with a plain lower wall or the wall broken with chair rail or panels. If possible avoid a figured paper unless the design and colors used are subdued. Introduce the necessary contrasting colors in hangings and other furnishings rather than in wall decoration. The quiet, refined appearance of the room illustrated has been destroyed by the use of the figured wall covering contrasting strongly with the white finish of the interesting wood features and mantel and destroying the decorative effect that should have been produced by the pictures and the brass articles on mantel shelf and bookcase. One must look closely to discern the candlesticks and the foliage of the landscape picture above the bookcase becomes insignificant against the large figured background. It is not our plan to condemn decoration for wall surfaces, but to point out the evils of the highly ornate surface especially when the same is to be used as a background.

Note the change in the general appearance of the whole room with the walls treated in a plain flat tint. There is a little contrast between tone of wall and woodwork and yet enough variation produced to bring out the architectural features of the room. We have taken as our example a not unusual room so that the difference could be appreciated, although there are other items in this room that could be slightly changed to better appearance. Too much symmetry has been produced by the placing of the brass jars on either end of the mantel and in front of either on floor, a candlestick on either side of picture and small jar beside each, etc. As the brass jars have been placed on the floor for utility, the other items should be arranged or rather grouped accordingly. The large jar on left end of mantel could be dispensed with entirely without destroying the balance of mantel. A heavy cornice in place of the moulding will also improve the appearance greatly. The picture over bookcase could be hung a little higher, as the top of bookcase looks rather crowded and over-burdened. The wall spaces of this room are sufficiently broken and interesting to make the plain wall far more effective than the figured.

It will be found a simple matter to remedy a room that has been unfavorably treated. A soft gray, a light buff or subdued green for walls, using a plain paper or employing a flat wall paint would be a great improvement. The latter permits of frequent washing, this being more desirable than wallpaper that gathers dust and requires renewing. Wall papers can be removed by hot water or paste applications. Professionals prefer the latter, as the paste retains the moisture and loosens the old paste more quickly than several water applications, as the moisture is quickly absorbed. Even though it is found necessary to paper it is wise to remove old covering. Any cracks can be easily filled with plaster of paris and the walls prepared for painting. Then again a silver gray, buff or buff stone and bright sage or maple green can be employed unless a warm tone is required. Flat-tone is recommended as it is easily applied, can be secured in attractive colors and forms such a good background for further decoration. This material should be applied as follows on walls not previously painted: First apply a coat of flat-tone liquid thinned bulk for bulk with flat-tone mixing size. Then apply second coat flat-tone liquid and follow with a last coat from can, allowing sufficient time for drying between coats. If liquid flat-tone is a trifle too heavy for the second and third coats it may be thinned with pure spirits of turpentine.

HOW TO KEEP WELL IN SUMMER.

In the July Woman's Home Companion Dr. Jean Williams, writing on "How to Keep Well in Summer," says, in part:

"In general, to lighten the digestive burden during the summer months, eat sparingly, especially of the heat-producing foods. Add green vegetables and fresh ripe fruits generously to the diet. Avoid underripe, overripe or partially decayed fruits as you would poison, for that is exactly what they are. Strawberries and other small-seeded fruits disagree with many people. In such a case, use only the juice of the fruit.

"Ice water, so commonly and copiously consumed, is very bad for the stomach and sometimes very dangerous. Acute indigestion is often caused by drinking it. As for the ever-present soda fountain, though not all is evil that flows from its faucets, there are few persons whose health will not suffer from indulgence in the heavily sweetened, over-flavored, ice cream nut chocolate mixtures that are sold so much more commonly than the wholesome grape-juice, apple-juice, lemonade, zoolack, matzoon or buttermilk. The last named three not only serve as agreeable, refreshing beverages, but are most valuable foods as well.

"Finally, let me urge everyone to cultivate the holiday spirit. If you can't have a long vacation, take a short one. If you can't leave your work at all, manage to make your work conform in some manner to summer standards. Picnic as much as you can, if you enjoy it. Eat out of doors, if you can do so in comparative privacy. In these respects home keeping women are much more fortunate than their brothers and sisters, husbands and fathers out in the business world because much of their work can be taken out of the stuffy rooms into the air. Fortunately we are all rapidly learning how much of a factor in preserving health this outdoor life may be, and how much it will help us to make our summer not only healthful but happy."

To clean your vinegar cruet, put a teaspoonful of lye in it, fill it full of water, and let it stand a few days. Then rinse thoroughly, and it will look as bright and clean as when new. This is also good for cleaning old jugs.

PRUNES.

A housekeeper says she does not cook prunes. She washes them thoroughly, covers one inch deep with tepid water, sprinkles over them what sugar is desired, and then soaks them from 12 to 24 hours. If the fruit is very dry and hard it may be placed on the warming shelf of the range so as to keep warm while soaking. If a richer syrup is desired the juice is drained off when the fruit is soft, boiled down and then poured over the fruit again. It is claimed that this treatment makes the prunes taste just like fresh fruit. We always soak prunes for several hours before cooking, then simmer slowly with a slice or two of lemon, using the water in which they were soaked for the cooking. There is a great difference between the well-soaked fruit, which has much of its lost moisture restored before cooking, and the tough, insipid, hastily cooked prune which is so often offered, bringing excellent and wholesome fruit into disfavor.

CUSTARDS.

To make custards successfully, cook the soft custards in a double boiler over hot, not boiling, water, and stir constantly. The custards to be baked should be set into a second dish half filled with warm water.

A good formula to use for custards of any sort is the following: One cup of milk, one egg, one tablespoon of sugar and flavoring to taste, added (in case of soft custards) after the custard is cooked, but while it is still hot.

To restore a soft custard which has separated or "curdled," set the dish in cold water and beat with an egg beater until smooth.

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A lobe tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Hay.

Scott, Magner & Miller say:

Hay arrivals on the San Francisco market during the past week have amounted to 4500 tons, which large amount about equals the arrivals of a week ago. The bulk of these arrivals have moved off fairly well, although a large part had to be taken care of by the large dealers.

In our large hay districts the bulk of the hay is being directed into the storage warehouses, and the fields are being rapidly cleared, and we believe that all will be cleared from the fields earlier this sason than for many years past. During the week there has not been much activity on purchasing account in the country, although a number of sales have been made of small lots.

There has been quite a lot of hay sent forward on vessels during this week for export account; in fact, quite a round shipment was made for the government for use in Honolulu under a contract dating back several months.

The market on alfalfa still continues decidedly inactive as there is not much coming in, and the demand for this article is also very slow. Last season large orders were placed in this market for shipment to the North, but apparently there does not appear to be any opportunity on the present market values of our alfalfa to ship any of it into the Northern markets.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	14.50@15.00
No. 1 wheat or wheat & oat	12.50@13.50
No. 2 wheat or wheat & oat	11.00@12.00
Choice tame oat	13.00@13.50
Other tame oat	10.00@12.00
Wild oat	9.00@11.00
Stock hay	5.50@6.50
Alfalfa	9.00@10.50
Straw, bale	45@55

Grain.

Wheat	1.40@1.47½
Barley, fancy	1.37½
Barley, good to choice	1.32½@1.36¼
Oats, white	1.50@1.60
Rye	1.42½@1.47½

Alfalfa seed	18
Millet	3@3½
Flaxseed	5@5½
Broom corn seed, ton	25.00@30.00

Feed Stuff.

Alfalfa meal	15.00
Bran, ton	28.50@30.00
Feed cornmeal, ton	37.00@38.00
Cracked corn	38.00@39.00
Rolled barley, ton	28.00@29.50
Rolled oats, ton	29.00@30.00
Middlings	32.50@35.00
Oil cake meal	42.00@43.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.00@31.00

Deciduous Fruit Market

Manager F. B. McKevitt of the California Fruit Distributors reports:

Sacramento, August 5, 1911.

The following gives number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, August 4, 1911:

Peaches—376¼ cars. Peach shipments show a gain of over 100 per cent since last week. They will probably continue in about the same volume for the week to come, after which they will begin to decline. Elberta is the variety most largely going forward at the present time, although there are considerable number of Crawfords and Fosters still moving. Late Crawfords and Susquehannas will soon be in evidence. The bulk of the crop will be moved by the 20th. Peaches now going forward are of fine quality.

Plums—112¾ cars. Already a considerable decline is noticeable in volume of shipments, and this will be greater as time goes on. It is probable that the movement for the coming week will not be more than 75 or 80 cars, after which time there will be very small quantities available. Wickson are now nearly done, German, Sugar, Kelsey, Splendor, Giant, Gros, and a few Grand Dukes constituting the leading varieties.

Pears—349 cars. It is believed that this week marks the heaviest movement of pears for the season. Shipments have already begun to decline slightly in the Sacramento River District and will continue to do so until the close of the season. Not many are going forward from Suisun at the present time, but shipments from that point and from Vacaville will be considerable next week.

Grapes—124¾ cars. A heavy increase is noted in the shipment of this fruit. The principal varieties are Thompson Seedless and Malaga from the Fresno district. A few Rose of Peru, Muscat and Tokay are being forwarded from the Vacaville and Winters district. Tokay shipments will cut no figure for another week, after which time they should be in fairly good supply from the early districts. Grapes are of unusually good quality this season. Mildew has been quite prevalent in practically every section where table grapes are grown. Having been promptly treated it will have but small effect on the crop.

Weather conditions continue very favorable.

Comparative statement of shipments up to July 29:

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	1110½	528¾
Plums	1290¼	772½
Pears	1320½	517
Grapes*	100¾	26
Apples	57¾	...
	4420	2274½

*A discrepancy in shipment of grapes is noted, owing to the fact that 36 cars, not reported in comparative statement of shipments for the week, are accounted for in the market letter.

Citrus Fruit Market

LOS ANGELES, Aug. 9, 1911.

A slightly easier tone prevails on the orange market owing to continuance of large receipts of local fruits in the Eastern markets. The quality of Valencias is so high, however, that the demand is sufficient to clean up at fair prices all the offerings up to this time. Of course, the easier tone has compelled slightly lower prices, but a better range is maintained than two years ago when a similar large crop of Valencias had to be handled.

The general lemon situation is decidedly easy and the whole market is more or less influenced by the present tariff agitation.

Shipments.

Shipments of oranges to date since November 1st, 1910, 34,890 cars, lemons 5885, total 40,775. To same date last season: Oranges 23,936 cars, lemons 4105, total 28,041.

NEW YORK, Aug. 8.—Eleven cars Valencias sold. Market is steady on fancy grades, lower on ordinary and poor grades. Weather fair.

SUBIRRIGATION.

(Continued from Page 131.)

and clog the openings with any permanently rooted crop.

"It is well known that roots will enter a very small opening in a pipe to reach the moisture inside, and that they will enlarge after getting through. This is true of the sugar beet, but it is possible that the root of a sugar beet could not enter such small openings as the pores of the pipe made in Texas.

"With crops that are renewed each year, such as some of the vegetables, subirrigation has, I believe, been made successful. In many of these cases, however, the underground pipes were as much for drainage as for irrigation, the localities being where the soil is moist in some seasons of the year and dry in others."

Get in the habit of looking for the silver lining of the cloud, and when you have found it, continue to look at it rather than the leaden gray in the middle. It will help you over many hard places.

Seize, then, the minutes as they pass;
the woof of life is thought;
Warm up the colors, let them glow by
fire or fancy fraught.
Live to some purpose, make thy life a
gift of use to thee—
A joy, a good, a golden hope, a heavenly argosy.

The soul of God's heart moving on,
Owns but the Infinite for home;
Whatever with the past has gone
The best is always yet to come.
—Lucy Larcom.

Marketing the California Honey Crop

Ripeness the First Essential of Good Honey

Written for the Cultivator by Ralph Benton

At this time of the year when the honey is on the hives and in the extractor and in the tank, a few pointers in regard to successful marketing seem opportune. It is an acknowledged fact, in the commercial world, acknowledged as far East as Florida, that although citrus shipments from California are yearly and in season monthly increasing, there is yet no cutting or glutting in the market, so well handled is the citrus enterprise. There are perhaps three outstanding reasons why the citrus market stands fast and keeps pace with the growers behind the market. The first of these is ripe fruit—a first-class product carefully graded, and neatly and attractively packed. Here is a lesson well worth considering by the California honey producer.

Grading and Packing.

First of all the man who expects consistently to have a regular market for and secure a good price per pound is met with. The demand of the market that comb honey be practically all sealed precludes in a large measure the possibility of unripened honey in this form reaching the market. The extracted honey producer may wish to know when his honey is ripe. With reasonable degree of safety it may be said that honey that is thoroughly capped is ripe. We are mindful of the fact that completely capped comb honey sometimes sours or sweats; but we are of the opinion that such fermentation is due to some extraneous or other cause rather than to an improper ripening on the part of the bees. However, this is one of the fine points in the chemistry of honey yet to be determined. The pertinent fact for extracted honey producers in this connection is that honey does not have to be entirely capped and in some instances even capped at all to be reasonably ripe. We say capped at all advisedly. For all practical purposes

A Ventura County Bee Ranch.

for his honey must produce uncompromisingly an evenly good product, the very best that his ranges will permit of. It is not necessary that it be a water-white honey, but of whatever grade it is, let it be properly graded; let it run even within a grade; let it be priced consistently in accordance with its grade, and above all, let it be thoroughly ripened and neatly and attractively packed. Second hand and battered or rusty cans should never be used and sticky, besmeared and weather-beaten cases should never be tolerated.

When Is Honey Ripe?

It is gratifying to note that beekeepers are slowly coming to realize the importance of having their honey thoroughly ripened before extracting it. There never has been much question about unripened or green comb honey in the market though occasionally sweated or fermented comb honey except under rarely occurring conditions at least a third to one-half of the honey should be capped before it can be safely pronounced ripe.

The popular notion abroad that the worker bee just before capping the honey cell, inserts her sting and injects a drop of formic acid for the ripening and preservation of honey is a fallacy without a single recorded observation to ground it on. That formic acid turns up in a chemical analysis of honey, that it has, no doubt, preservative qualities, and that the chief glands for the elaboration of formic acid are the poison glands connected with the sting, are observed and known facts; but in drawing the popular fallacious statement above cited, is where the error enters in. In this dilemma a physiological fact comes to the rescue, e. g., that a test for formic acid may be secured from any of the internal structures of the worker bee and that this is especially true in the glands and glandular products in the head and thorax of the bee concerned with the transformation of flower rectar to honey.

Evaporation not Ripening.

Time was when the evaporation of water from flower nectar or from partially ripened honey was thought to be the essential process of the ripening of honey, and that this could be done as well artificially or in the honey tank as by the bees in the hive. The pendulum is now on the backward swing as experience and investigation indicate that the ripening of honey is not merely evaporation, in itself a physical change, but that it involves certain chemical changes, which changes cannot be wrought as far as present knowledge goes except by the same little toilers who are likewise the only recognized agents for the collecting and storing of flower nectar in available quantities for commercial purposes.

Chemical Composition.

Flower nectar when first gathered contains on an average 76 per cent water, 9 per cent invert sugar, 12 per cent cane sugar and 3 per cent chiefly dextrine and ash. The maximum or minimum percentage of these compounds recognized as the standard for honey by the American Association of Chemists, is as follows: Not over 25 per cent water, not less than 64 per cent invert sugar, not over 8 per cent cane sugar, not over .25 per cent ash, with a balance of 2.75 per cent chiefly dextrine, including a trace of formic acid. The average American honey contains over 7 per cent less water than permissible by the standard and about 6 per cent less cane sugar, the lessening amounts of these two compounds permitting a considerable increase in the amount of invert sugar. Aside from the diminution in amount of water in the process of ripening honey from 76 per cent, the figure for flower nectar, to 25 per cent, the maximum figure allowable in honey, which on the average falls to 17.59 per cent, and in California sage honey as low as 16.43 per cent, it will be noted that the greatest change is the relative amounts of invert and cane sugar present—a change brought about in the process of ripening through the agency of the bee, a process which cannot be accomplished artificially. The relative figures of sugar in flower nectar stand 9 per cent to 12 per cent cane; in the standard not less than 64 per cent invert to 8 per cent cane; and in the average honey 74.52 per cent invert to 1.98 per cent cane. The great amount of increase in invert sugar might be said to be due to the decrease in amount of water, but this same law of proportion would also increase the percentage of cane sugar which is far from the case. In fact despite the diminution in water the 12 per cent of cane sugar in flower nectar is reduced in actual percentage in California sage honey to 3.39 per cent and in the average American honey to 1.98 per cent. The following tabulations are given to facilitate making comparisons:

Type	Water	Invert Sugar		Cane Sugar	Ash	Dextrine	Formic Acid	Undetermined
Flower nectar	76.00	9.00		12.00	.25	2.75	.....	.....
Chemists standard	25.00	64.00		8.00	.25	2.75	Tr.	.....
Average for America	17.59	74.52		1.98	.23	2.09	.09	3.61
Poplar honey	17.02	65.80		3.10	.76	10.19	.19	2.94
Honey dew	15.46	64.84		5.27	1.29	10.01	.15	2.98
		As Levulose	As Dextrose					
Alfalfa	16.56	40.24	36.85	4.42	.07	.34	.08	1.43
Sage	16.43	24.35	46.40	3.39	.07	.62	.06	8.68

BEE OUTLOOK IN THE SAN JOAQUIN VALLEY.

By J. G. Gilstrap, Ceres.

This spring was rather cold and rainy and bees did very poorly during the spring months. I never saw bees so stubborn in manipulating for queen rearing. Swarming was light during March and April; about May 1st nearly all drones were killed off. About the twentieth of May the weather changed to warmer with less wind, and drones! well, they are at this writing, June 3, filling all available drone comb with brood. Until this change of weather many had to feed the bees, but now they are laying in some surplus, and taking the swarming fever. The outlook for a honey crop is better than usual now. Beekeeping is receiving more general attention in this part of the state than ever before, and 'ere many years this is going to be quite a honey-producing section.

BEES BUILDING COMB UPWARDS.

Lately mention has been made in different bee papers of bees building comb upwards, and pictures of such combs have been given. The fact is that bees will probably always build in that way when conditions favor it. At the beginning of the honey harvest it sometimes happens that place has not yet been given for storing surplus, but an empty super is over the brood-chamber. In that case, if the super is deep enough the bees will surely begin building upward from the brood-frames.

A peculiarity of this upward building is that the bees do not build straight, parallel combs, but circular. It is easy to see a good reason for this. Set a sheet of tin on one edge, and it will immediately fall over. But bend the sheet into a curved form and stand it up on the curved edge, and it stands upright. Just so a straight comb built upright would fall over sidewise, while the circular comb stands erect.—American Bee Journal.

Citrus and Tropical Fruits

TRICKS OF THE TARIFF.

By F. J. Dyer.

The farmer and fruitgrower is likely to feel that he is too often discriminated against by the railroads, by the tariff, by the commission men, by almost everyone with whom he comes into contact. He has so long been pictured as a "rube" who readily buys green goods and gold bricks that he is tempted to think, at times, that even Uncle Sam looks on him in that light. For years the farmers have been asking for the same measures of protection in the tariff that has been accorded freely to the laboring man and the manufacturer. Has he got it? Not always. Occasionally the man who tills the soil has got something but it has been hard won, and no sooner did he get it than powerful forces were arrayed to snatch it away from him.

Take a concrete case. In Florida and California the climate was found to be suitable for growing oranges and lemons. Enterprising pioneers in both states took up the new lines with enthusiasm. They met with many discouragements and setbacks. There were insect pests, frosts, droughts, scarcity and high cost of labor, unknown problems to solve, years to wait for returns, and competition from foreign lands when other problems had all been reduced and success achieved. Orange growing reached a stage where the home growers controlled the market and competition was little feared. Lemon growing continued to be a hard fight, although the problem of producing a better lemon than the imported had been solved and 50 per cent of the home market was supplied by home-grown lemons The extension of the market was checked because the importers, with cheap home labor and cheap ocean freights, could and did, keep the American fruit from reaching the seaboard whenever they wished to do so. Congress wanted to give the American growers an even break, and added one-half cent per pound to the tariff on lemons, or about one and one-third cents a dozen, one-eighth of a cent on each lemon. During the hottest portion of the summer lemons sold in Washington at 10 and 20 cents a dozen. No one found any complaint with this except the Italian importers in New York City. They started in at once to raise a slush fund to fight the tariff. The growers in Sicily and Italy agreed to pay from 5 to 10 cents on each box of lemons imported into the United States to help fight the tariff. They began a campaign to arouse the American public to a belief that it was being wronged, and to influence Congress to remove the tariff on lemons. Congressmen were appealed to by the agents of the importers, the pushcart men and the retail fruit dealers. Untruthful petitions were circulated, so untruthful that their mendacity was evident at a glance. One form of petition refers to the "burdensome duty on lemons," alleged to be "for the purpose of doubling the wealth of ten or a dozen millionaires of California, and also for the purpose of paying the wages of tens of thousands of Japanese soldiers who exclusively monopolize the labor of the California lemon orchards, thus depriving American laborers of opportunity of labor and wages." This is very absurd as well as false. To patronize the foreign lemon growers and steamship companies would be better, the importers think, than to patronize American railroads, American orchardists and American labor. Japanese are employed to a very small extent in the region where lemons grow. If there were enough white labor they would not be employed at all. Moreover, oranges and lemons are now grown in Arizona, Texas, Florida, Alabama, Mississippi and Georgia.

Such petitions as those just referred to have been circulated at Atlantic coast summer resorts by "barkers," such as those who attract attention to the shows at seaside amusement parks, and many small boys signed them. Posters have also been displayed by these Sicilian agents charging the "high cost of living" on the lemon tariff, which would not cost the average person one cent in a year, if anything at all, for lemons have actually been cheaper this year than they were before the duty was increased, so that the dealers (who are really at the mercy of the importers), are promising a great deal if they promise to reduce the cost of lemons in case the present tariff is repealed.

The fact is that the duty was not a serious burden to the importers until very recently, because the execution of the customs regulations permitted them to claim, and to obtain, a rebate for alleged rotten fruit, amounting sometimes to fifty per cent of the cargo, which they were clever enough to sell afterwards as first-class, sound fruit. This has been stopped. A close observer in Washington said recently:

"What the government has lost in customs frauds will never be known, but as Collector Wm. Loeb, Jr., has shown at New York alone, the sum must reach many millions of dollars. Importers have shown the greatest cunning as well as unscrupulousness. They have had to refund millions of dollars to the treasury department. Some of the Italian importers were sent to jail. The Italian lemon importers are the latest to have been circumvented, but the government had to revise the regulations for the importation of lemons in order to head them off, and it took eight months to find out how to meet the case. Aided by an almost unlimited 'slush fund' put up by the Sicilian lemon growers, and by very shrewd and resourceful lawyers who are spending money lavishly to buy magazine and newspaper space, the Italian importers are now seeking to have the tariff revised in their interest. This is not the first time foreign interests have tried to shape legislation in Congress, but it is one of the boldest."

The way the treasury department stopped the importers from obtaining too big an allowance for decayed fruit was to make the estimates for rot on the samples displayed for sale. Almost any disinterested person would say that this was fair, but the importers protested wildly and vehemently. The treasury department, however, thought mere noise no argument, and the amount of money collected has increased.

The fact is, the tiller of the soil, although he thought it a bad thing for him that the reciprocity treaty should go through, has got to be con-

sidered when it comes to fixing up a list of producers who must have a fair share of protection. Legislation by Congress should be for the benefit of the people Congress represents, and not for the benefit of Sicily, Japan, Mexico, Spain, or any other country.

One reason why many men, after retiring from business undertake orange and lemon culture is the romantic interest attaching to it in a land where winter is unknown. But they need some profit to keep them interested in their work. Unless the efforts of the importers to cripple the industry in California shall succeed, the orange and lemon groves of that state will prove to be among the most interesting things the visitors to the 1915 Panama Exposition in San Diego and San Francisco will see.

ALLIGATOR PEAR, AVOCADO, AHUACATE?

When in 1530 Cortez landed in Mexico the Ahuacate was a popular fruit among the natives, and had been known to them under that name many centuries. And it was so much prized by the conquering Spaniards that it was soon introduced in Santo Domingo, Cuba and the other islands which still retain the name of West Indies. In the British Colonies the name of Ahuacate became corrupted into Alligator pear, and in the French islands into Poire d'Avocat and Avocatier. In our own times this French corruption gave birth to the name of Avocado, which has no meaning, and no historical base. Why, in the name of common sense, must not the name of Ahuacate be retained? It is the aboriginal name and it is no more difficult to pronounce than Avocado.

In South America, where the tree is not as common and not so popular as in Mexico, it bears the name of Palta, said to be originated from a locality in Peru, where it was first brought into notice. A more hardy form, with rather small fruits, is known in Chile under the name of Paltita, that is "small palta."

Quite recently somebody has fancied to change the old respected and expressive name of Persea Gratissima of Linnaeus into Persea Americana, evidently a misnomer, there being several other species of the genus Persea which are native of the American continent. One cannot protest strongly enough against this modern craziness of creating new names for old things.—Dr. F. Franceschi.

Mr. J. P. Gilbert, of the University of Illinois, said in a recent lecture on "Birds of the Farm and City," that the hunters of the cities who did not realize the value of birds to farm products made possible an annual loss from farm insects to crops and forests of the United States of $70,000,000.

Mr. Gilbert said it was due to destruction of quail in Illinois that the potato bug was becoming such a pest; that quail on the table is worth a few cents, but that quail on the farm is worth many dollars; that every hawk and owl is worth on an average $30 to the state; that one "flicker" can eat 5,000 ants at a single meal; that the kingfisher is the most powerful defender of the poultry yard in existence.

The state of California has appealed its case wherein the question has been raised as to whether certain Palo Verde lands are overflow lands and consequently state property. The former decision was in favor of settlers who have filed homestead claims.

Spraying

NOTICE: To People Who Spray—or Ought To

The Bean Spray Pump Co. are celebrating the twenty-fifth anniversary of their organization by making the most important single invention ever added to a spraying outfit. It wonderfully increases the value of their new sprayers and can be fitted to old outfits.

On the quarter century anniversary they have also made the power sprayers much more complete than ever before and then reduced all prices lower than ever.

You are cordially invited to see these new outfits. They will be exhibited so far as possible in every locality where two or more parties are interested. The itinerary is now being planned and a prompt reply on whichever blank below fits your case will make it possible to let them show you what they have.

Bean Spray Pump Co.,
212 W. Julian St., San Jose, Cal.
Gents:

I expect to buy a { Power Sprayer / Hand Pump } this season, and, without any expense or obligation on my part, I should like to have a copy of your new catalog and to see your latest outfits, including new invention.

Deciduous Fruit Culture

FERTILITY OF THE ORCHARD.

One of the problems that always confronts the fruitgrower is the keeping up of the fertility of his orchard. A tree has been compared to a cow tied to a stake in the pasture. The cow can get along very well till she eats up all the grass within her reach and then she must be moved to a new position or feed must be carried to her. The roots of the tree will ultimately consume all the fertilizing material within their reach but the tree cannot be moved like we moved the cow. This comparison is not a perfect one for all the grass within the reach of the cow can be used as fast as she needs it, but much of the fertility reached by the roots of the tree can not be used as fast as it is needed for the very simple reason that much of the fertility in most soils is not in the available form. That is a fortunate condition in many cases, for if all the fertility could be used at once, two things would happen; one would be that the soil would be too rich, and the other would be that the soil would soon be completely exhausted. So when we speak of the exhaustion of the soil we say that it will "ultimately" be exhausted.

Seven elements of fertility must be in the soil in order for plant growth. Some of these are used so sparingly that it is often said of them that they are practically inexhaustible. Iron, sulphur and magnesia are of this class. Lime may be abundant for a long time and it may not be. To treat of lime and its function in plant life would require a separate article. The three elements of fertility that we must be constantly looking after are nitrogen, phosphorous and potash. These three must be found in sufficient quantities and in available form or trees or any other kind of vegetable, will not do well. If these are kept in the soil and in some cases the lime is looked after all kinds of plants will flourish.

Now, in view of the importance of nitrogen, phosphorous and potash we often see the recommendation to buy these combined in proper proportions. They should always exist in the soil in proper proportions, but it does not follow at all that they should always be bought combined in the proportions in which they should exist in the soil. A little reflection will convince any one of the saneness of this statement. One of these elements may be so nearly exhausted as to need to be replenished while the other two may be abundant. This condition often exists. It is well understood by those who carefully study these things that some soils become deficient in nitrogen, while the phosphorus and potash are abundant. This condition prevails today in more orchards where the soil is volcanic ash than many persons are aware of. I have had this condition in my own orchard and have applied the remedy with absolute success.

It is often recommended that analysis of the soil be secured, in order to learn what elements are abundant and what are deficient. That will not be an infallible guide for the very simple reason that the elements may be in the soil but not in the available form. The best guide I have ever found is to study the conditions of my trees. This is especially the case so far as the presence or absence of nitrogen is concerned. Nitrogen gives vigor to all plants. So we may know that when trees look vigorous and their leaves, during the growing season, have a dark green color, that nitrogen in the available form is abundant, but if the trees look feeble and the leaves have a palish look, during the growing season, we know that nitrogen is lacking or that it is not in the soluble form. To buy a combined fertilizer in such cases would probably be a waste of money. Should we buy nitrate of soda, commonly called Chili saltpetre, and apply it to the soil in the spring it would work a great change. But I would never buy nitrate of soda or any other form of commercial nitrogen for the simple reason that I can get all I want for nothing. This I will explain:

Nothing is so abundant all about us as nitrogen; 79 per cent of the air is nitrogen; every time we take a breath of air into our lungs four-fifths is nitrogen. But this nitrogen of the air cannot do plants one particle of good, because it is not in the available form. The free nitrogen combined with soda, potash, magnesia or lime becomes nitrates. Chili saltpetre is nitrogen combined with soda, hence is known as nitrate of soda. Now, our plant physiologists have found out that certain kinds of vegetables have the capacity of taking this free, unavailable nitrogen of the air, and combining it with certain elements in the soil, can furnish nitrates just as good as we can buy. These plants are called legumes, because they grow their seeds in pods. These legumes not only make all the nitrates they need for their own growth, but leave a residue in the soil for the benefit of other plants. These legumes have little nodules on their roots which are filled with nitrates. The best known of these legumes are the clovers, alfalfa, the vetches, peas and beans. There are others, but we need not now mention them.

When an orchardist finds that some of his trees are beginning to look feeble he need not rush off and buy nitrate of soda, guano or some other form of commercial fertilizer, but let him sow clover among his trees and he will find that the vigor will, in a few years, return and continue as long as some legume is grown in his orchard. Sweet clover (Mellilotus alba), so much despised by many farmers as a weed, is one of the best nitrogen-gatherers; so are vetches, especially the hairy vetch; so are beans and peas.

Some five or six years ago a man who owned a good orchard of bearing apple trees came to me and said that some of his apple trees had lost vigor, and that the fruit was not so large as it had been. He said that he had thought that it was something lacking in the irrigation, and that he had tried to thoroughly irrigate these feeble trees, but there was no change for the better. He said the condition was a mystery to him, for his trees along his laterals in his orchard remained vigorous and he had supposed that the irrigation had something to do with their vigor. Upon examining his orchard it was found that alfalfa seed had floated in from a meadow through which the water runs before coming to the orchard and the result was that alfalfa was growing vigorously for two or three rods on each side of his main laterals. I had the same condition in my own orchards. There was the solution. This growth of alfalfa was replenishing the failing nitrogen and thus keeping up the vigor of the trees. But where there was no alfalfa the trees remained feeble. Then I explained to the man that his orchard had, to some extent, exhausted the supply of nitrates in the soil and that

he must buy nitrates or build up with legumes. In my own orchards I have built up the nitrogen content and have never paid a cent for commercial nitrates and never expect to.

People who have lived some years in the country where alfalfa is raised for hay, know that if they plow up an old alfalfa field, that it is enormously rich. Plant young trees in such a field and it will be seen that they will grow very rapidly and the foliage will be very dark. Plant such a field to potatoes and the yield will be phenomenal. The fact is that such fields are very rich in nitrates. Where alfalfa or the clovers cannot be successfully grown I would recommend field grass. If we plow under a crop of vines now and then and let them rot it will help in restoring the nitrates, for when vegetables decay in the soil it helps in the formation of the valuable nitrates. Some people think that even the legumes will not benefit the soil, unless the tops are plowed under and allowed to rot, but we now know that that is a mistake, for many an alfalfa field has been made immensely rich that has never been plowed at all. This is known by my own experience.

Millions of dollars are paid out every year by the people of the United States for Chili saltpeter. Now, I will not say that all this might be saved by the growing of legumes, but I do most unhesitatingly say that much of it could be saved in that way. So important is this matter that the Department of Agriculture is carrying on experiments along this line. Professor C. V. Piper, formerly a student and a graduate of the Washington State University, and for some years professor of entomology at Pullman, is at the head of this work. He has sent us seeds of the various legumes and we are carrying on experiments in our orchards. He has visited our orchards to look into what we are doing along this line. He is in full accord with the ideas set forth in what I have just written about legumes. He believes that much money spent in importing nitrates could be saved by growing these nitrogen-gathering plants. One of the chief points we are trying to settle for him is to find out what legumes will reseed themselves, for it is too costly to buy seeds for the annuals. We have practically settled that red clover, hairy vetch, yellow tree-foil and sweet clover can be depended on to reseed themselves. By the use of the legumes and alfalfa, which being a perennial, needs no reseeding, we can make our soils rich in the nitrates at no cost at all except the starting. The great importance of this matter and the great saving to be secured by the study of this matter and the growing of legumes is my excuse for treating the matter so fully.—F. Walden in the Ranch.

APPLE ANNUAL.

Preparations for the "Apple Annual," California's great apple show, the second one of which will be held at Watsonville October 9-14, are forging ahead and prospects are that last year's success will be eclipsed. In addition to creating an interest in a better and more uniform pack, more careful selection and other features tending to improve the market for local packers and growers, the first Apple Annual held in 1910 was remarkable in its demonstration of the apple growing possibilities of other sections of the state.

For example, there were fifteen counties represented. These took one hundred first prizes and thirty second prizes. Tuolumne county took thirty-four first prizes and ten seconds, a most remarkable showing, each prize being awarded, not for manner of display, but quality of fruit. Sonoma county won twenty-three first prizes and eight second prizes, the apples from that section being splendid specimens. Eldorado was close after Sonoma with twenty-three first and three second prizes. Siskiyou county sent one exhibit only, but it won a first prize. Santa Clara carried off three, San Luis Obispo four, Mendocino three, Butte five, Los Angeles one, Modoc four and Mariposa one.

It is expected under the stimulus of more prizes and cash prizes this year the displays from districts outside Santa Cruz county will be larger and greater than ever. The premium list is now being prepared and will be ready to announce very soon.

Additional space has been provided for this year, the large auditorium constructed especially for the purpose of housing the annual having proven entirely inadequate.

Last year's exhibit consisted of twenty-six carloads of six hundred forty boxes each—a low estimate—one hundred forty apples to the box, or three million, two hundred fifty-five thousand, two hundred eighty-three apples, more than ever exhibited at any show in the world. Allowing each apple a diameter of three inches and placed end to end, the fruit would have reached from Watsonville to San Francisco and across the bay to Berkeley.

ENSILAGE IN SUBTROPICAL COUNTRIES.

By A. E. Vinson, of the University of Arizona Agricultural Experiment Station.

The increasing agricultural prosperity of those communities in the cold and humid corn belt, where dairying predominates, is probably due to the silo as much as to any other single factor. The silo has made possible a dependable supply of succulent feed through the long, cold winter, and has thus increased the annual output of the herds. By eliminating husking and subsequent care of the grain the silo has decreased the cost of harvesting and feeding ensilage crops, and has retained upon the farm much valuable fertilizer. In humid countries siloing is especially adapted to preserving coarse fodders, such as corn and sorghums, which cannot be cured easily as hay; or crops which suffer loss of leaf and fruit in handling dry, such as cow peas.

The lack of silos in the warm, semi-arid Southwest is due to several causes. The principal forage crop being alfalfa, a considerable supply of green feed is available throughout the greater part of the year; and corn, the principal crop for ensilage in the north, is grown to a more limited extent. Thus the attention of ranchers has been less directed to the subject, although four or five silos have thus far been built in Arizona. On the other hand, under our climatic conditions, hay can probably be made and handled more cheaply than ensilage, and does not require expensive buildings for its preservation.

The advantages to be anticipated from silos in this region are several. A supply of succulent feed could be kept available for the short winter period of poor pasture, and again for the long period of summer drouth. This is especially important where dairying is practiced and where there is a scant supply of irrigating water for the pastures in late spring and early summer. In some localities it might be possible to grow fodder corn or sorghum with the summer rains. This forage could be siloed and fed to range stock during the drouth of the next year, or used to fatten them for market. It has been found by R. W. Clothier, Agriculturist of this Station, that as much as three and one-quarter tons per acre of sorghum can be produced by dry farming methods in some parts of Arizona. As he suggests, this could be preserved as ensilage in succulent condition until needed.

Another advantage of ensilage as compared with dry feed is its especially favorable influence on the production of milk, increasing the amount and improving its color and that of the products made from it. The coarser parts of the forage are also more closely eaten than when fed dry, and the loss of tender leaves and of seeds avoided.

Observations in Northern Africa.

Although silos have long been in successful operation in cold countries, there has been no experience establishing their value in the semi-arid, subtropical Southwest. Observations, however, on the practicability of silos under these conditions have been made by the writer during recent travels in the French provinces of Northern Africa. Several planters were interviewed who are using the silo, and others who contemplate building silos soon. Algeria and Tunis are, in most respects, very similar to our own Southwest, so that, as far as climatic conditions are concerned, we may expect French experience to be of value to us.

A planter at Boufarik, in Algeria, who has been very prosperous and is well known throughout that region for his intelligent and successful management, has used a cemented pit silo for over thirty years. He states that he fattens three times as many animals per unit of land with corn ensilage as are usually fattened with hay of oats and vetch, locally called "forage." His ensilage has kept in good condition in that climate for two years. In March, corn siloed the previous summer was found excellently preserved. Various legumes, including alfalfa, have been successfully siloed at that place. Alfalfa, however, must be fully matured or else allowed to dry partially before being put away. The pomace from the wine presses is also siloed after the residual alcohol has been distilled off, but the resulting feed is of low value and probably could not be profitably fed where labor is expensive.

The silos at Boufarik are of the old style pit form. The entire group of pits, measuring about 40 by 150 feet, is divided lengthwise by a central wall and subdivided by cross walls of stone masonry into smaller pits of from thirty to eighty tons capacity. These pits extend ten feet below and the walls rise four feet above the ground. The depth is limited to that convenient for removing the ensilage. Doorways through the upper part of the wall are provided for each pit. The roof is carried on masonry pillars, leaving the space above the walls almost entirely open. All the pits are cemented on the inside and provided with cement floors. After thirty years of continual service these silos are in fairly good condition, excepting that the longer dividing walls are somewhat sprung from the pressure of the ensilage, and in some places have required bracing. The owner has found but one fault in their construction; the roof is too low to permit stacking sufficient material to make up for subsequent settling. The cut feed is piled as high as the roof will permit, covered with eighteen or twenty inches of chaff or fine cut straw, over which boards are placed, and the whole weighted with stone. The straw decays, but the green feed immediately below is generally found to be well preserved. The same planter has recently constructed other silos on the same general plan, but with higher roofs, which allow much higher stacking and insure a full pit after fermentation is completed.

The Silo.

Silos of the pit form described above are not recommended under our conditions, because of the labor involved in packing the ensilage sufficiently,

and in placing and removing the final weighting material. The losses also are generally greater than with above-ground circular silos. They offer some advantages for siloing small crops which cannot be mixed in the same silo, such as corn and beet leaves and tops, because they are easily divided into smaller units by partitions. This is not practicable with the round silo. The high silo has been found to be most economical, because the weight of the contents is sufficient to compress all but the top layers of ensilage, and these can be fed before they spoil.

A discussion of the details of silo construction is not within the scope of this publication. Such information, however, is readily accessible in any of the numerous handbooks on silos, farm management and kindred subjects. For that reason only a few of the leading principles will be mentioned.

Silos should be round, because that form encloses the greatest volume with the least wall space and leaves no sharp corners to prevent the settling of the ensilage. For the same reason the inside walls should always be as smooth as possible. They may be built of masonry, concrete or wood. Masonry silos are highly satisfactory when cemented smooth on the inside, but their cost is usually prohibitive. Concrete silos are durable, and will find favor in localities where cement is moderate in price, and lumber expensive and subject to rapid decay. Since protection from frost is unnecessary in the Southwest, reinforced concrete silos with relatively thin walls could probably be constructed to advantage. Wooden silos are most popular where lumber is plentiful, because they are serviceable and easily and cheaply constructed. In northern climates, with care not to have them in use during the summer, they last many years.

The older forms of wooden silo were built of staves set on end and held together by iron hoops provided with tightening devices. This form has proved very satisfactory. The newer structures are built of 2x4 studding erected on a suitable circular foundation and bound together both inside and outside by a double layer of tightly fitting wooden hoops, arranged to break joints. These hoops consist of thin boards bent and nailed to the studding. Tarred building paper may be placed between the layers of hoops to make the silo more impervious to air and better protect the material next the wall.

The size of the silo should be governed by the number of animals to be fed. The volume of ensilage removed daily will vary with the depth from which it is taken, since the material near the top weighs about one-third as much, volume for volume, as material at the bottom. One cubic foot per day, however, may be taken as the average quantity consumed by each dairy cow. In very warm countries it is desirable to use daily at least four inches of the unprotected surface material to prevent spoiling. Experience may show that even more must be removed. For this reason the silo should not be too large. Two small silos will be found more serviceable than one very large one. The silo should be as high as consistent with convenience in filling, since by this means the pressure is increased, air excluded more perfectly, and preservation of the ensilage in-

Small Fruits and Vegetables

GARDEN NOTES.

A Missouri grower sends this: If you are growing tomatoes for market it will pay you to use stakes. Either set a stake at each end of the row and run a wire along, tying the plants to the wire, or two wires if that number will be needed. A single stake for each plant is better than the wire, and the plant should be large enough when transplanted to need the wire at once.

A subscriber, speaking on the same subject, writes: Where land is limited, cucumbers and tomatoes may be grown on stakes or trellises. Chicken wire is good for this, or tomatoes may be tied to stakes driven in the ground at each plant, and then all but two or three branches kept cut off, tying those left to the stake as they grow. This results in a little less fruit per plant, but more plants may be planted on the same amount of space. Three feet apart each way is enough.

The South Dakota station conducted some interesting experiments last year on mulching potatoes with straw instead of cultivating them. The straw mulched seed required several days longer to come up, and the vines were more irregular in size during the early summer than those planted deep and cultivated. Later in the season, when the drouth and hot winds affected the cultivated field, the soil under the mulch was soft enough to make mud balls. At this time in the season the mulched potatoes grew very rapidly. When harvested it was found that the straw mulched potatoes were much larger in size but were not as well matured as those cultivated. In a year when there is sufficient moisture there probably would not be any difference in yield, but in a season of drouth the mulch prevents the moisture from evaporating, and consequently there is more of it for the use of the potatoes. If the farmer desires to use mulch, it should be applied at once.

The Department of Agriculture says that tobacco dust is one of the most effective methods of combating cabbage lice. This dust is applied with a bellows blower, or may be shaken on the plant with a pepper box. The blower gives the better results of the two, as it puts the material on with more force. Hot water or strong soap suds heated to a temperature of 130 to 140 degrees Fahrenheit may also be used effectively against these insects. The hot water or suds applied as a spray or with a brush at the above temperature will not hurt the plant, but will kill the lice.

Hellebore is especially recommended for use in the destruction of gooseberry worms and the larvae of saw flies. It is less poisonous than the arsenicals and loses its strength when exposed to the air for any great period. It may be applied dry or mixed with water. If used dry it may be mixed with flour or lime or may be dusted on the plants in pure form. If used with water the proportion is at the rate of one ounce to three gallons.

The man who reads of $1,000 to $2,000 profits per acre in onions or any other crop, and loses his head to the extent of planting a half acre as a first venture, not knowing whether his soil and climate are adapted to the crop or what chances of sale or storage he has, does not use proper discretion.

Globe varieties of turnips are best to set out now for winter use. If planted in the middle of August they should be allowed to grow until freezing begins. They can either be kept in a cold cellar or buried.

If you want your lettuce to make large heads, transplant it, placing the heads one foot apart.—Journal of Agriculture.

THE FOOD VALUE OF WEEDS.

The United States Government has been experimenting with the food value of "weeds" which have heretofore been considered worthless. It has found that many have higher values than well-known staples of food, and that they are not only palatable, but often delicious.

The government has made another investigation into cheap food plants and vegetables that are used abroad and in little-known corners of the world. As a result, whole colonies of nutritious food plants have been imported into the United States.

The roots of the golden thistle have been found to be very delicious and are used like salsify. They may be dug in September and kept through the winter.

Leek is now honored as a food staple. It has very excellent properties and is excellent for flavoring.

The common mallow is a weed that roots very deeply and thus draws valuable mineral elements to the surface. It has a mild, mellow flavor, and those who like lettuce find it delicious. The young leaves are tender and crisp. It is a valuable tonic.

The fields and pastures abound with one of the most valuable vegetables, which is being cultivated in gardens and so planted that it lasts the entire season through. This wild vegetable is the common milkweed, and it is wonderfully delicious. The flavor, when cooked, is exactly like that of asparagus.

The milkweed should be cut when it is about a foot high. Boiled like asparagus and served with butter is the usual way of cooking; it is also delicious as a salad uncooked, the tender tips only being used in this case. The milkweed has medicinal properties and is excellent for the kidneys.

Another weed which when boiled in the same manner as spinach makes a most delicious and nourishing dish is that commonly called "lamb's quarter." The color in the month of June, when it is at its best, is a light silvery green.

The ordinary wild nettle that grows in prickly abundance in every yard and fence corner has long been used in India as a plant food, and has of late years also been eaten in Austria and Italy. It is a good substitute for spinach if properly cooked.

Borage is a weed that used to be extensively used, not only for its leaves, but for its flowers, in salads and also in refreshing drinks, like mint. This was used years ago in Europe and England as a salad and a garnish in drinks, and Martson, in "What You Will," says: "If you have no bottle ale, command some claret wine and bourrage."

To use flower bulbs as vegetables seems a strange thing, and yet those of the dahlia and nasturtium have been found to be excellent. The single red variety of dahlia is the one cultivated for its tubers, and in good soil it is as productive as the sweet potato. They may be planted from seed in early May, and by the middle or last of July the tubers are large enough to dig.

Those who start out to raise dahlias as a garden crop can make a most profitable business of it, for they may have a most gorgeous garden of flowers during the summer and autumn, and then gather in the tubers for a part of the winter food supply.

The ice plant is another familiar flowering pot plant with which we are all familiar in hothouses and gardens. It is now said to be as wholesome as spinach, and in many ways better, as it is not so acid.

The Ornamental Garden

SPRAYING DANDELIONS.

By W. L. Oswald, Minn. Univ. Farm.

From the large number of inquiries received at the Experiment Staion regarding the eradication of dandelions, it is apparent that dandelions this year are more numerous than ever on our lawns.

For the past two years, iron sulphate has been used at the Minnesota Agricultural Experiment Station for the eradication of dandelions in lawns. Fairly good success has resulted from these experiments. Although spraying the dandelions does not by any means mean absolute destruction of this pest, it at least kills many of the flowering stalks, and keeps hundreds of dandelions from coming to seed. It also kills many of the younger plants. If one were to spray a lawn carefully once a month for an entire season, the results would possibly warrant the time and expense connected with the spraying. Sulphate of iron is a by-product in the manufacture of wire, and costs from one to two cents per pound. Sulphate, at the rate of 1½ pounds to 1 gallon of water, is the proper proportion to use on the lawns. The solution should be applied with a sprayer which gives a very fine, mist-like spray. This is possible only with a sprayer that has a pump attached so that considerable pressure can be obtained. Apply the solution about three days after the lawn is cut, on a day that is bright and warm. The grass will be somewhat blackened, but little damage results. Some of the white clover, owing to its broad leaf, is somewhat injured. The lawn should be sprayed about once a month. Care should be taken, when spraying, to keep the solution off of the cement walks, as it discolors them.

Prof. LeRoy Cady, of the Horticultural Division, advises that lawn grass seed be sown about two days after the lawn has been sprayed the first time. It has been found at the Experiment Station that the mixture which makes the best lawn-grass seed is made up of blue grass, white clover and red top, at the rate of 14 pounds of blue grass to 2 pounds each of red top and white clover. This seed should be sown broadcast and raked in. Besides this, nitrate of soda at the rate of 150 pounds to an acre should be scattered over the lawn. The nitrate of soda should be applied before a rain, or should be applied in the evening and the lawn sprinkled. The grass will burn if it is not wet after the nitrate of soda be applied. The object sought is to thicken up the grass and thus allow less chance for dandelions.

A FEW DEPENDABLES.

I would not advise the amateur gardener to attempt to grow all the kinds of plants that appeal to her so strongly from the beautifully-illustrated pages of the florists 'catalogs. Better start out with a few of the best, and concentrate your attention on them. By and by, when you have achieved success with these, you can "branch out" and add to your collection as extensively as you please.

The question may be asked—What kinds are best? This is not easy to answer, because individual taste enters largely. But with reference to hardiness, freedom of bloom, ease of culture, and adaptability to all grounds, I would name the following as the best dozen that can be selected from the long list of desirable kinds adapted to amateur culture: Hollyhock, perennial phlox, iris, delphinium, pink, herbaceous spirea, peony, rudbeckia, pyrethrum, companula, dicentra, and the hardier lilies, like the old-fashioned "Tiger," Speciosum album and roseum, of the Japanese class. In "drawing the line" at this dozen, I am well aware that a great many will take issue with me, because it fails to include some old favorites of theirs, but, for the class for which it is intended I feel confident that it will be found as satisfactory a selection as can well be made. It confines itself to plants that any one can grow—and grow well—with the least possible care and the greatest certainty of success, and this is the kind of plant all amateur gardeners ought to choose to experiment with. Every one of these plants will do well in almost any soil—an item that should be given careful consideration by the beginner—for there are many plants that will not succeed under ordinary conditions.

It may be urged that a collection of only a dozen plants is too small to give much variety. But each of this dozen has many varieties, differing in color, size, form, and season of flowering, so that it is not necessary to confine oneself to a plant of a kind. Indeed, so many are the varieties that one might fill a good-sized garden with the representatives of but one plant, without duplicating anything. There is thus a wide range of selection, and it is possible to suit all tastes, in most respects, without going outside this number.—Eben E. Rexford, in Country Gentleman.

PRESERVATION OF CUT FLOWERS

Everybody but those commercially affected will be glad to learn of methods by which not only is the life of flowers in water prolonged, but, in addition, buds are induced to open with greater freedom, and in some cases the colors deepened and improved. The Revue Horticole has published the results of experiments with a great variety of flowers, and declares that such excellent results may be obtained from simply adding sugar or salt to the water that we advise our readers to put the matter to a test themselves. The saying has it, "What's one man's meat is another's poison," and this apparently applies to flowers with much greater force. Sweet peas are said to last best in pure water; carnations to last longest in a 10 to 15 per cent sugar solution; roses in a 7½ to 10 per cent solution; and chrysanthemums in a 15 per cent solution; whereas lilies, lilac and pelargoniums do better in pure water than in sugar solutions, but respond to an addition of 5 per cent of common salt (one pound to two gallons of water). Experiments with other substances, such as nitrates and chlorides of soda and potash, resulted in failure, and in some cases hastened the decay of the flowers, with the solitary exception that phosphate of potash was found to prolong the life of orchids, but the results were no better than those obtained from a 10 to 20 per cent sugar solution. Very possibly florists and some others have long been familiar with these facts, but if so, and of the nature of a trade secret, it has been very well kept.—Gardening.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

PRESSURE FOR FREE LEMONS.

California lemon producers must awake to the fact that tense effort is being made to force the lemon issue. As one of the small indications we quote from the New York Times of August 7th, from a clipping sent us through the courtesy of Mr. W. C. McCully of Corona.

The article is headed in large type, "Coney Island Hears Lemon Duty Blamed. New York Merchants Send Lecturer to Explain the Matter to the Holiday Crowd. Petitions to Congress Asking Tariff Reduction Are Signed." From the text following we quote:

"In the midst of the professional barkers who make a bid for the nickels and dimes of the holiday crowds at Brighton Beach, there stood yesterday afternoon an earnest young man who made no appeal for money, but merely urged the passersby to listen as he denounced one particular item of the tariff, and asked them to sign a petition calling upon Congress to reduce the duty on lemons. During the afternoon and evening he succeeded in getting about a thousand signatures to this document. It reads:

"'To the House of Representatives of the United States, Washington, D. C.

"'Gentlemen: We, your petitioners, respectfully request the repeal of the burdensome duty on lemons which was enacted by the Payne-Aldrich bill into a law—at the expense of the great masses of population on the Atlantic seaboard—for the purpose of doubling the wealth of ten or a dozen millionaires of California, and also for the purpose of paying the wages of tens of thousands of Japanese soldiers who exclusively monopolize the labor of the California lemon orchards, thus depriving American laborers of opportunity of labor and wages.'

"The lecturer is the paid representative of New York lemon merchants, whose business has materially suffered by the increase of duty from 1 cent to 1½ cents a pound. He has a small table and many big bundles of petition blanks, and displays large posters, printed in red and blue ink. Ceaselessly he and his assistants descanted on the evils of the lemon tariff.

"'Sign a petition to Congress,' cried one of the orators. 'It costs nothing. You could get six lemons for 5 cents, but now you get only two for a nickel. The tariff is to blame for high prices. Don't you want cheaper lemons, cheaper lemonade, and cheaper lemon ice cream?'

"To those who stopped to speak to the lecturer in chief he explained that last year the lemon imports from Italy amounted to 150,410,536 pounds, of a value of $3,072,735, and that the duty collected on them was $2,256,158. One and a half cents per pound duty, he asserted, is equivalent to about 74 per cent. ad valorem, although diamonds—articles of luxury—pay only 10 per cent.

"Some of the men who signed petitions yesterday were from California, the home of the lemon growers.

"The New York lemon merchants are trying to get a free lemon amendment on the Farmers' Free List bill, which is in conference, and are urging their Congressmen to take the matter up.

"Congressman Francis Burton Harrison, a member of the House Ways and Means Committee, has sent this letter to a constituent:

"'I am very glad to have your recent communication about a reduction in the duty on lemons. I am heartily in favor of having the duty reduced on this necessary of life. I spoke against the raise in the duty on lemons in the last tariff revision, and voted against it, and am now doing all I can to get a lower duty.

"'There is no single item in the whole tariff which shows more clearly the iniquitous workings of a high protective tariff. The purpose in the raise in the duty was simply to give the California lemon growers exclusive control of the markets of the East, especially New York City, so they might be able to charge the poor people in New York a higher price for lemons.

"'You must do everything in your power to keep this question before the public and thus help your Representative to get the duty reduced.'

"Most of the New York Congressmen are interested in getting the duty reduced."

NONE TOO EARLY.

We received a circular recently in which the catch phrase was used "$75,000,000 reward for the capture of Jack Frost." It was simply one way of stating the fearful loss which comes from the visit of this dreaded foe of all kinds of fruit and practically all farm products. Will we have an early frost? Will we have a late frost? are questions of every fall and spring. Citrus growers and those handling products of semi-tropical countries not only have the early and late frosts to contend with, but lowering of temperature at any time in the winter strikes terror to their hearts.

Fortunately the last few years have seen the question of frost conditions more fully investigated. Still more, they have seen orchardists in a more or less effective way making efforts to control its ravages. These efforts have led to several different "systems" of frost fighting. Almost all of these are good, some are better, and a little investigation can be made at this season of the year to learn what is of most value to the orchardist and aid him in claiming part of the $75,000,000 reward. There is absolutely no question in the minds of intelligent orchardists that good effects have been obtained by the use of these systems.

The expense of fitting the orchards to combat the cold still prevents many from protecting themselves. Some years there is no occasion for it, so the careless grower prefers to gamble on the proposition, and if the frost comes he pockets his chagrin instead of the coin he should have had. Already orders are being taken for next season's pots and stoves, and it is none too early, for everyone who is not already supplied to begin to make careful investigation.

GENERAL CROP CONDITIONS.

On August 9th the Crop Reporting Board at Washington reported general crop conditions as fairly favorable, at least more so than might be anticipated in consideration of the intense heat of late June and early July. The report is made up of estimates from correspondents and agents of the bureau scattered over the country, and from these corn shows a condition of 69.6 of normal, which is less than 10 per cent decline from last year, but is a very great decline from conditions obtaining on July 1st. On that date it was reported as being 80.1 per cent of normal. The acreage this year is in excess of last year's by 1.7 per cent, making a total of 115,939,000 acres.

Barley shows a better average condition, being 66.20 as compared with 70 per cent last year. The acreage, however, has declined, being only 97 per cent of normal. The total barley acreage in the United States is 7,038,000.

Potatoes are also decidedly off, showing a condition of only 62.3 as compared with 75.8 last year, or still worse, 84.8 for the ten-year average. The acreage is also slightly under average, or 97.3, a total of 3,495,000 acres for 1911.

The condition of apples is 47.8, while the ten-year average is 53. The falling off in condition during the month of July was 4 per cent.

If the percentages prove correct, it will indicate that corn will yield 22.6 bushels to the acre, barley 19.8 bushels, potatoes 72.5 bushels. Preliminary estimates now being made indicate that winter wheat will yield 14.5 bushels per acre. This will make a total for the country of 455,149,000 bushels. This is about 10,000,000 bushels under last year's production, but better than the five-year average. The quality of winter wheat is slightly lower than last year, being 92 per cent as against 92.6.

DON'T.

Touching upon forest fires and good points to observe to put them out before they are started, may we suggest:

Don't toss away burning matches or tobacco.

Don't make a campfire in leaves, rotten wood, or against logs, where it may spread or where you cannot be sure it is out.

Never leave a fire until it is out.

Don't burn a slashing in the dry season without a permit and without taking care to keep the fire from getting away.

Put out any fire you find if you can. If you can't, notify a fire warden, some other public officer, or the land owner."

JAFFA AT GARDENA.

At the farmers institute to be held at Gardena next Monday, August 21st, Prof. M. E. Jaffa of the State University will make an address on the topic of poultry feeding. Prof. Jaffa is one of the best informed men on the scientific side of poultry culture in this state, and we doubt not poultrymen from many parts of Southern California will attend. The meetings will be held in the Agricultural High school, and it is understood Prof. Jaffa's address will be in the afternoon beginning at 1:30.

It is a fact well known, now, that speculators in Palermo, Sicily, and in New York City, joined hands to secure the reduction in the lemon tariff which in 1910 paid into the U. S. treasury the very respectable sum of $2,223,527.87, as compared with collections of $1,351,758.88 for 1909, the year before the tariff went into effect.

One of the Cultivator's exchanges recently appealing for more attention to good roads, good roadsides and well-kept places on the ground that these are valuable assets to any community, states that progress is contagious. Nothing truer could have been said and the owner who keeps his place in good order shows pride in his community and accomplishes more than good to his immediate surroundings, for his example will be followed by others.

Agricultural News Notes of the Pacific Coast

Northern California

Chico, Butte County, reports its biggest crop of hay.

Healdsburg prune growers are propping heavily laden trees.

Preparations are being made to organize an irrigation district.

The Sebastopol cannery has a large force of hands canning berries.

Extensive levee improvement is planned for Sutter County below Yuba City.

One Meridian, Sutter County, barley grower has sold his crop of barley at $1.25.

The Ehman Olive Co. of Oroville, Butte County, is shipping olives to France.

The Gravenstein Apple Show at Sebastopol is to be opened by Luther Burbank.

A pumping plant has been installed at Colusa which will irrigate over 100 acres of orchard.

El Dorado County fruit growers are shipping heavily and receiving most satisfactory prices.

A fruit grower at Loomis, Placer County, nets $647 from one and one-third acres of Burbank plums.

Eight thousand acres of fine land of Tehama County has been recently purchased and will be subdivided.

The largest dairy in District No. 70 in Sutter County is about to be established by Marin County capitalists.

Much trouble has been experienced with strikers at the Crockett plant of the Hawaiian Sugar Refining Company.

Sonoma County Japanese fruit growers have raised $600 to aid in making an exhibit at the coming Gravenstein Apple Show.

Horticultural Commissioner Galloway of Sonoma County urges immediate spraying for the last brood of codling moth.

Large shipments of Crawfords and Tuscan Clings are being made from Marysville and other points in Yuba and Sutter Counties.

It has been announced that bottom lands along the Bear river near Rio Oso, Yuba County, will soon be subdivided into small tracts.

The peach orchards near Bogue, Sutter County, are presenting a busy scene, much of the fruit being shipped to the cannery at Fruitvale.

Contra Costa County people are discussing the formation of a promotion organization which will look after the best interests of that county.

Shasta County hop growers are elated over present market indications and are even hoping for a 30-cent price before the season ends.

An irrigation scheme is under way near Lakeport, Lake County, which contemplates the impounding of sufficient water for irrigating 16,000 acres of land.

Chico, Butte County, claims the largest oak tree in the world, located on the Bidwell estate. Its height is 150 feet, and the branches have a spread of more than 200 feet.

The increase in fruit shipments from Bogue and other points in Sutter County has brought a promise from the railroad company to give increased freight shipping facilities.

Central California

The shipment of Malagas has begun from Fresno.

Tokays are ripening very rapidly in the Lodi District.

Merced reports great increase in acreage of alfalfa.

Stockton has ambitions to become a great poultry center.

Turlock plans a two-day melon carnival August 24 and 25.

The big potato fair celebration at Salinas proved an immense success.

San Joaquin Thompson Seedless grapes now arriving in Chicago find a good market.

Wineries at Las Palmas, La Paloma, Lodi and Elk Grove have merged into a million dollar corporation.

The state dairy inspector on a recent visit to Kings County caused the arrest of several Portuguese dairymen.

Wine grape growers and wine men of the valley have united to conduct a campaign in the interests of the wine industry.

Some orchards of the Santa Clara Valley show exceptionally good results from spraying with lime solution for the thrips.

Diseased squirrels have been found in the Tule River Reservation, and it is feared that some may be infested with the plague.

A prune carnival will be held in connection with an annual industrial exposition to be held at San Jose, September 14 to 23.

The California Fruit Canners' Association has been paying to Selma orchardists 10 cents for 1911 peaches and 4½ cents for raisins.

California Fish and Game Commission will investigate the matter of deer killing and the advantage of protection of this game in the state.

The horticultural commissioner of Fresno County is keeping close watch on all alfalfa fields to discover any possible infestation of alfalfa leaf weevil.

Fresno finds damp and cool weather delaying the maturing of grapes and the picking of Malagas was stopped last week because of much green fruit.

Valencia oranges are all shipped from Lindsay and packing houses are closed. The coming Navel crop promises to be rather larger than last year's.

Salmon are reported in the Kings River where they were unknown three or more years ago. The irrigation weirs have created better conditions for them.

The Watsonville Apple Annual management estimates that last year's show, which was a great one, will be distanced in quantity and quality of exhibits this year.

The Zante Citrus Association has elected officers for the coming year as follows: W. L. Hemphill, Pres., W. H. Grant, Secretary and Manager; other directors, A. M. Lumley, Geo. Hall, G. S. Langford, G. H. Vosburg.

The city of Los Angeles now has an inspector at Tulare keeping tab on the various shipments of cream. He has given warning that if dairy products are shipped without observation of rules, they will be dumped on arrival in Los Angeles.

Southern California

San Diego will build a produce market at a cost of $80,000.

Santa Ana apricot growers and dryers have paid out over $80,000 for labor of gathering and cutting fruit.

The largest well in the valley is being bored at Perris, Riverside County. It is twenty-four inches in diameter.

The orange packing house formerly used by the California Citrus Union at Redlands burned last week, loss $13,000.

A corporation has been organized to bring under cultivation 20,000 acres in Piute Valley, San Bernardino County.

Almost 3000 cars of cantaloupes were shipped out of Imperial Valley. This is approximately 1000 more than last year.

Santa Paula fruit growers are planning to build levees which will keep Santa Paula creek within its banks at flood time.

Skeletons of many deer have been found in the burned area of the great forest fire in the San Bernardino mountains.

Sugar beet growers near Fullerton, Orange County, have had trouble with laborers demanding excessive prices for harvesting.

Horticultural Commissioner Bishop of Orange County is making an effort to rid the county of Johnson grass and morning glory.

The Valley of the Yucaipa in San Bernardino County reports greater quantity and finer quality of apples than any preceding year.

Orange County reports that an excellent crop of apricots has been dried and that a $300,000 crop is now in the bins ready for the market.

That the flood season of the Colorado has passed was emphatically proved on one day recently when the river receded one foot in 24 hours.

Peter P. Hovley of Brawley is taking early steps to more thoroughly organize the cantaloupe growers for the handling of next season's crop.

The appropriation by the last legislature will enable the pathological laboratory at Whittier to make greater research for the benefit of the fruit industry.

The stones were hardly cold on the slopes of the San Bernardino mountains when the forest service began making plans for replanting the burned area.

The apricot canning season ended recently at the Colton cannery, over 700 tons of cots having been handled. This was 100 tons in advance of last year's output.

Riverside claims the record breaking sunflower, the head 30 inches across and the seed bearing center 17½ inches in diameter. The stalk was 11 feet tall.

Imperial Valley is estimating that three quarters of a million dollars worth of lint will be gathered in the fields of the valley this year. The picking is just beginning.

Volunteer cotton crop of the Imperial valley has been declared to be a success and doubtless another year there will be greater attention to this manner of growing cotton.

The Coast

Grain growers at Lewiston, Idaho, are busy with harvesting.

Lewiston, Idaho, has a field of grain which it is asserted stands nine feet high.

Many new varieties of long fiber cotton are being grown near Yuma, Arizona.

The siphon to carry the waters of the Colorado under the bed of the stream to lands above Yuma is nearing completion.

Grape growers near Yuma, are planning the construction of a grape juice processing plant.

The twenty-first annual district fair will be held at The Dalles, Oregon, October 3-6.

The fruit acreage of Okanogan County, Washington, has doubled during the past year.

The Governor of Hawaii has appointed Chas. S. Judd as commissioner of public land.

A county fair is assured at Klamath Falls, Oregon, and will be held the first week in October.

An agricultural school is to be established in the Lanao District in the Island of Mindanao, P. I.

The Prune Fair and Carnival planned to be held at Dallas, Oregon, is to be held during September.

A movement is on foot to introduce to the Hawaiian Islands insectivorous birds to aid in the fight on the many pests.

Plans are being formed for the Second Annual Apple Show under the auspices of the Eugene, Oregon, Commercial Club.

The output of the Oregon hop fields will be from 95,000 to 100,000 bales, and it is expected the crop will bring to the state $5,500,000.

A hop buyer at Chehallis, Washington, has just purchased ten tons of 1911 hops at 30 cents. The Chehallis crop will be about 2000 bales.

The aggregate increase of the value of livestock of the state of Nevada during the last decade was $6,000,000, an increase of over 54 per cent.

Hot winds over many parts of the state of Washington caused some injury to wheat fields, variously estimated at from eight to ten per cent.

The Annual Apple Show for Oregon will be held at Portland, November 15-17. In connection with it will be held a meeting of the state horticultural society.

Loganberry growers at Salem, Oregon, have good contracts with dryers and it is predicted that loganberry planting will be greatly extended another year.

A large sugar estate near Manila, Philippine Islands, has just received from the states 4,000,000 pesos to be used in the development and extension of the estate.

People at Fairbanks, Alaska, enjoy the luxury of eating strawberries at $2.00 per box, though some bargain days have been announced with the ordinary pound box selling at $1.50.

Mrs. Littlepage, a soil and irrigation expert of the Department of Agriculture, said to be the only woman expert in these lines, is investigating conditions near Klamath Falls, Oregon.

Animal Matter a Necessity For Poultry

Experiments at various State Experiment Stations have demonstrated beyond a doubt that Protein derived from an animal source is far superior, as an egg producer and flesh builder, to Protein derived from a vegetable source.

Our High Protein "Special" Beef Scraps Will Supply That Necessity

If your dealer cannot supply you, write us, and we will send you samples and price.

Made in California from fresh Packing House Products. Look for the word "Special" in red ink on every sack.

Western Meat Co., San Francisco, Cal.

Dried Milk for Fowls

Nothing better, especially in hot season; nearly 50% protein. Special prices for short time only:

Harding's, $3.50
Casein Co.'s, $3.50
Bent's, $3.75

5 Sacks 15c and 10 sacks 25c less

WEST COAST SEED HOUSE

221, 213, 115 WINSTON ST. between 4th and 5th near Main. LOS ANGELES

Catalogs of Everything for Poultry and the Garden

BUY LAYING HENS NOW

PRICES ARE LOWER RIGHT NOW THAN AT ANY OTHER time of the year. If you need hens take our advice and buy them right now. We can supply fine young White Leghorn yearling hens at $8.50 and $9 per dozen. No matter how many you wish, we can supply them at this price right now. These prices are good this month only. In July and August hens are worth more in September these same hens will be selling at $12 and $15 per dozen. Buy them now and make a big saving. Send today for catalog of prices on baby chicks of all kinds, hens and pullets, etc.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

MORE ABOUT DUCKS.

By Mrs. A. Basley.

Indian Runners are exceedingly easy to raise, being ready for the market at ten weeks of age and commencing to lay at four and a half months when hatched early. In writing about them seven years ago when I had a fine stock of them I said "I hatch under hens, remove to brooders, give them heat for only a week or ten days (according to the weather) they do better in the brooder than with hens, as the hen often treads on them or knocks them over by scratching. I find that more fertile eggs hatch under hens than in incubator. I heard of an eastern duck breeder who advocates putting duck eggs into an incubator for six days, then testing the eggs and placing the fertile eggs under hens, refilling the incubator with hen's eggs immediately till about two days before hatching time when he changes, again putting the duck eggs into the incubator for the hatching time and giving the hen eggs to the hens to hatch out. He claimed that by this means he got an eighty per cent hatch of duck eggs whilst most of the large duck farms in the East get only sixty per cent hatches in the incubator. A sixty per cent hatch in the incubator and eighty-five to ninety per cent under hens was my average for ducks. I do not know why they hatch better under hens. It may be that the perspiration of the hen being both oily and acid has something to do with it." You can tell by the smell and feel of the feathers of the hen that it is a peculiar perspiration and I think it assists the eggs to hatch. I wish someone more learned than I could discover why hens hatch so much larger per cent of duck eggs than incubators do. Duck eggs, of course, require different handling in the incubator to hen's eggs, more ventilation, more cooling off and drying out and also sprinkling with warm water, but even with all this extra trouble they do not hatch as many as under hens.

Now about the food for mature ducks. Green food and animal food are necessities. In the East where the ducks have a good range on grass they will find all the greens they need, but here the lack of green has caused many a failure. An alfalfa range in California is the best for ducks (and for geese also). They find ample supply of green food and the insects which abound in the alfalfa form a valuable addition to the animal food. In the wild state ducks would find quantities of grubs, bugs and worms, which supply the meat needed, but in California during the dry hot summer there is a great scarcity of worms and insects and consequently meat in some form must be fed.

The dry blood or meat meal mixed in the mash will answer as well as meat, but the most successful that I have known was a lady living on an alfalfa ranch, where the artesian water always flows. Small frogs and tadpoles abound and the ducks almost live off of them. The little food she gave them at night in mash to bring them up to the yard where they were kept at night, did not cost two cents per month per duck. She kept them in at night to protect them from the coyotes and also to gather the eggs in the morning, or they would have gone down to the water to lay them by day break. Ducks lay their eggs either in the night or very early in the morning and they are not at all particular where they lay them. I had, however, one duck that preferred to lay in a trapnest and she would wait more patiently than a hen for me to let her out.

This land cleared $67.50 in five months with ten ducks. Indian Runner ducks are small feeders in comparison to Pekins. They lay over two hundred eggs per year, looking like and tasting like a hen's egg, not strong like other duck eggs, and bring the same price in the market, though my friend above mentioned always received five cents per dozen more for them than for hen's eggs. Her customers used to beg for them in preference to any other kind; they said they were better flavored.

Indian Runners are easy to keep, are light feeders consuming less food than Pekins although laying continuously. By actual test I found that it required no more food for a flock of Indian Runners than for the same number of White Plymouth Rocks and if allowed free range on alfalfa or where they can find plenty of grubs, bugs, worms, or small frogs which they delight in hunting, they will make their own living. While they do best on free range they bear confinement well and can be kept in very small yards. They are ready for market as soon as the Pekin, that is, at ten weeks of age, and when they have reached a marketable age they have nearly attained their growth and have little left to do but to complete their plumage and begin to lay. Their wonderful laying qualities insure a constant supply of eggs the year around except from four to six weeks in the fall and when they are moulting. However at this season the late hatched ducks assume the work while their mothers are taking a needed rest.

The following feeding for ducklings is from men experienced in the business who are or have made fortunes with ducks:

(1) Ration for ducklings (Rankin): The first three or four days, one part hard boiled egg, three parts stale bread crumbs; after that equal parts of corn meal and wheat bran, boiled potatoes and a little beef scrap.

(2) Rations for ducklings (Hallock): First week, equal parts of cornmeal, middlings, crackers or stale bread, and green stuff; mix in a small handful of sand to each quart of food. Give occasionally bread soaked in milk for a change. Second week, four parts cornmeal, two parts wheat bran, two

parts middlings and one part beef scraps, sand; mix with one-third of the quantity of green stuff. At about six weeks put ducks in fattening pens, and feed two-thirds meal, the remainder about equal parts bran, middlings and greens; add about twelve per cent of the whole of beef scraps.

(3) Rations for breeding birds, young and old. (Rankin): During the summer and fall when they are not laying, feed three parts of wheat bran, one part Quaker oat feed, one part cornmeal, five per cent beef scraps ground fine and five per cent of grit, and all the green feed they will eat cut fine. Feed this mixture twice a day all they will eat.

(4) Ration for laying ducks. (Rankin): Equal parts of wheat bran and cornmeal, twenty per cent of Quaker oat feed, ten per cent of boiled turnips or potatoes, fifteen per cent of clover, alfalfa or refuse cabbage chopped fine, and five per cent of grit. Feed twice a day all they will eat.

There is one secret that the big duck men do not reveal, a secret for getting eggs, and that is, the ducks must have a plentiful supply of crushed clam shell before them at all times as well as fine grit. The most available shell, that is the shell that is most readily digested and turned into egg shell, is not the hard white shell, but the small pink or bluish clam. It is simply marvellous the effect that this clam shell has in persuading the ducks to shell out eggs. The lady I mentioned who made so much from her ducks knew a man who had a clam extract factory and from him used to buy the refuse shell after the juice had been extracted.

Another important part is the grit or sand. This is very essential for without it the ducks will die of indigestion. Cleanliness also is a necessity, especially for yarded ducks, and shade. The only illness I have met with here in the duck family has been from lack of shade, and from ducks having too shallow drinking vessels. In the first case the ducks had a kind of blind staggers and quite a number died. In the latter case the ducks' heads swelled up and the eyes became inflamed and closed up, because they had not been able to rinse out their nostrils.

The profits on ducks depends on how much feed has to be bought for them in the first place. If you have an alfalfa field, one sack of bran and cornmeal lasts a year, the profits would be immense. Then are you near enough to a good market? So much depends upon how you can sell and what you have to buy.

You can distinguish the sexes when they are about six or eight weeks old by the voice. The females "quack" loudly, while the male's voice sounds as if he had a sore throat, a sort of cross between a hiss and a whistle. The Fawn and White Indian Runners feather alike at first, so you get no help there in discovering the sexes. When young the males are sometimes longer in body and larger, as they also are when mature but all these signs are unreliable and the only certainty is the appearance of the curled feathers in the tail which appear at 12 to 14 weeks.

The English Standard for the Indian Runners is an entire pamphlet and it is difficult to pick out the chief points briefly, but a few hints will help.

The disqualifications are: Blue wing bars, claret breasts, distinctly bright green heads (like Rouen or Mallards) wry tails. All weights above 5 lbs. for females and five and a half for drakes and below three pounds for females and three and a half for males.

Length is greatly desired, 25 to 30 inches in ducks and 28 to 36 inches in males being considered good. The neck must especially be long, thin and fine; bill light orange yellow when young, the green spots which appear later changing to dull cucumber color in ducks and greenish yellow in drakes, when over a year old. Head flattened over the skull and eyes high up in head; bill wedge shaped, straight and fitting into the skull without any dishing; body tapers to behind shoulders and again as it nears the tail; legs must be placed well back, clear orange red as far as possible.

Color of cap and cheek dull bronzy green; neck white to where expansion begins. Body color soft warm ginger fawn, uniform to the skin, penciled for females on a shade of fawn not quite so bright. The penciling is to be rather indistinct, but is more plain on back and shoulders. The male a soft fawn peppered with a warmer shade. Pure white in flights is counted desirable, but is not insisted upon. Light clayey lacing and bold prominent lacing to be avoided.

Height, reach and a racy look characterize the breed. The chief aim of the English Standard is to condemn anything that leans toward Mallard or Rouen type and to keep the traits which make the Indian Runner distinctive or different from all others. Eggs are large and white.

A straight line from head down back to tail shows a good Runner, especially not having curves or angle at back of neck (a sign of Mallard blood). A short thick neck is considered very defective.

CARE OF GOSLINGS.

Goslings should be left in the nest or incubator for twenty-four hours after hatching, then fed with light bread soaked in sweet milk and young, tender grass cut up fine and mixed with it. If they will not eat it, open their mouths and teach them to eat it. Many are lost if left to learn alone, or are put out with their mothers until they can eat. Scatter blades of short grass among them, and they will soon learn to pick it up. Two or three feeds will usually teach them and save you many dollars. After they learn to eat this, feed unsifted cornmeal and bran.

Keep the mother indoors until the dew is off the ground, after which confine her to a small pasture if possible, as she will tire the young goslings by walking too far. Do not let them get chilled or get caught out in a heavy rain, for they are much more easily drowned than chickens. Exposure to cold, damp weather and wet coops will give them rheumatism. Plenty of grass and water are necessary, with a little grain, until the time for fattening arrives in the fall.—Journal of Agriculture.

LICE.

That lice are still playing havoc among the flocks of young chicks is evident from the number of inquiries we are receiving about how best to exterminate the pests. Again and again

"The Best Place in California to Buy Groceries is Los Angeles"

Thousands Are Now Convinced That McSTAY

is selling not only groceries, but everything to eat, wear and use at wonderfully low prices, actually saving the consumer the difference between the retailers' and the wholesalers' prices even after the freight is paid.

COMPARATIVE PRICES PROVE OUR CLAIM

We have lately received from a good many of our customers comparative prices as to what they have to pay locally, as against our prices. This positively proves that no matter where you live you can at least

We sell in any quantity from $5.00 worth to a carload. Begin now to save money.

Save Middlemen's Profits

All orders acknowledged same day received and shipments arrive on time.

Name. Address.	Our Price	Their Price.	Net Saving after paying freight.	Per Cent Net.
E. L. H.—San Dimas	$39.55	$53.86	$14.31	33
G. R. S.—Covina	15.64	18.44	2.44	15
W. H. P.—Banning	38.28	59.30	18.32	31
J. B. —Corcoran	14.90	21.90	4.63	48

in these pages have we told the readers how to keep the lice in check, but not until the chicks die do they pay attention to what was told them. The great secret about the lice problem is to have perfect cleanliness around the coops and premises, and by thus forestalling them the lice will not bother so much. After they do get a foothold, then there is only the most heroic treatment of whitewash, kerosene emulsion and carbolic acid to fall back upon, and this must be done quite often to keep them in check.—Kansas Farmer.

Kerosene emulsion is one of the best mixtures to use in combating mites in the poultry house. It is made by mixing two gallons of kerosene oil, one-half pound whale oil soap, or one quart home-made soft soap, and one gallon of water. Dissolve the soap by boiling in water, then remove from the fire and immediately add the kerosene. Beat this mixture rapidly and violently until the emulsion is as smooth as beaten cream. Bear in mind the vessel used in mixing this emulsion must be sufficiently large to hold a considerable increase in measure, as the bulk is nearly or quite doubled in emulsifying. One part of emulsion to seven parts of water is used to dilute the mixture for application to buildings, drop boards or nest boxes. Add one or two ounces of carbolic acid to the diluted emulsion just before applying. This is a splendid disinfectant and insecticide to use about the poultry houses.

Experiments show that exciting the hens, worrying them in any way, or running after them, retards the production of eggs. Scientists have found that an egg may be nearly developed and that excitement or moving will cause it to be re-absorbed by the hen's system. This proves that the hen in the laying pen should be kept as quiet as possible. The attendant should be careful not to disturb the birds any more than possible. Children should not be allowed to chase the hens all over the yard, and dogs should be kept away from them. In a number of tests it has been found that birds which were kept in back lots, away from the noise and excitement, produced more eggs than those kept where there was more noise, all else being equal.

ENSILAGE IN SUB-TROPICAL COUNTRIES.

(Continued from Page 151.)

sured. However, when very high silos are used and the cut material is quite green, the pressure near the bottom sometimes becomes sufficient to press out the juice. This is to be avoided. The empty silo must be one-third higher than the column of ensilage it is to hold; and then it will require refilling two or three times at intervals of several days to have it finally three-fourths full.

Care must be taken in choosing a well drained place for the silo. It is scarcely necessary to add that the silo should be placed so as to economize labor in feeding. It must be remembered, however, that the odor of ensilage is rapidly absorbed by milk; and, therefore, the silo should not be directly in the feeding room, nor should ensilage be fed immediately before or during milking.

The Ensilage.

Most crops with solid stems are suitable for ensilage, but those with hollow stems carry so much air into the silo that the ensilage does not keep well, although very green hay has been successfully siloed with cow peas. The material used must not be too moist, or the temperature of the first fermentation will not be high enough to destroy those germs that cause excessive acid fermentation, and the ensilage will be too sour. If not moist enough, air is apt to find entrance, resulting in moulding and decay of the entire mass. If crops are too green and moist they should be wilted before being siloed; and, vice versa, if too dry, a little water should be sprinkled over the cut material. By observing these points, even alfalfa and overripe corn have been successfully siloed. The loss of nutritive matter during the fermenting process depends largely upon the exactness with which these conditions are obtained. In the poorly prepared pit silo this loss may attain forty per cent or more, while in the well prepared round silo the loss may not exceed five or ten per cent.

The fodder may be chopped or shredded by any of the ensilage cutters found on the market. The cut material which is carried into the silo by an endless belt elevator or by a blower should be well distributed. A cone of chopped fodder must not be allowed to accumulate in the center, as this tends to sort the ensilage into coarser and finer portions. The weight of the cut material will usually be sufficient to pack the center. It is essential to tramp the edges well, since the material is apt to shrink away from the walls and admit air, spoiling the ensilage on the edges. This is done best by a man tramping around the edge with his back to the wall. The corners in a square silo must be packed with special care. A covering of boards over the top is all that is usually found necessary to preserve the top layer; but the added protection of a layer of finely chopped straw or chaff will probably repay the labor. Some have even sown grain thickly over the top, which soon sprouts and forms a cover almost impervious to air.

At Boufarik, corn for ensilage is planted so thickly that no ears form. It is then cut soon after it has come into tassel. This practice is contrary to the best American usage in the corn belt, where the ears, which are left on the stalks, greatly improve the quality of the ensilage, since a large part of the nutritive material of the plant is in the ear. In this connection, it is well known that in dry countries corn is fertilized with great difficulty, and unless it comes in silk and tassel during humid weather very few grains are formed.

Beet Leaf and Top Ensilage.

Beet leaves and tops for ensilage should be freed of dirt and sand by washing, regardless of any losses such treatment may incur. They should be well drained and somewhat dried, but need not be chopped before being put into the silo.

This material sometimes contains as much as 3½ per cent of oxalic acid in the dry substance, of which one-half or more may be soluble in water. Oxalic acid has the property of withdrawing lime from other substances, with which it forms an insoluble oxalate. For that reason it is best not to feed beet leaves or beet leaf ensilage to growing stock, since it is apt to produce unduly soft bones by rendering insoluble the lime necessary for their nutrition. Even for mature animals, the oxalic acid should be rendered harmless by adding one or two pounds of slaked lime per ton of leaves and tops when they are siloed. Since beet leaf ensilage has marked laxative properties, it must be combined with a liberal amount of straw or other dry forage. It is best adapted for feeding steers, but may also be given to sheep. Dairy cows are said to prosper on it, provided it does not exceed one-third of the total ration.

Corn ensilage may be fed to most farm animals, but the best results will be obtained when fed to dairy cows, due to its favorable action on milk secretion. Sheep may be given ensilage with profit if sufficient other dry feed be provided, since they usually thrive best on a rather dry ration. Steers for shipping may be fattened to advantage on a ration composed largely of ensilage, but should be finally fed on drier feed so as to lose less in transportation.

In certain sections of semi-arid countries where dry farming can be practiced or flood waters utilized in growing corn and sorghum, the silo will probably be found to enable the feeder to use more advantageously the natural pasturages, which during part of the year produce more than enough forage for the herds and flocks that can be permanently maintained upon them.

Questions and Answers

THE EDITOR AND STAFF

Processing Exhibition Fruits.

Please give formula for preserving fruits in large display jars such as Chambers of Commerce exhibit. I have exceptionally fine peaches and wish to preserve them for display. I find your paper a great aid in my ranch work.—J. L. Dwinell, Anderson.

We regret that we cannot give very definite information as to preservatives for exhibition fruit. Mr. Wiggins, in charge of the Chamber of Commerce of Los Angeles, which is perhaps as successful in this work as anybody can be, said that he could not give explicit information to anyone; it is a trade or science in itself and, as he remarked, there are not six men in the state who are entirely successful at it. Different fruits require different treatment. The same fruit grown in different sections, the same fruit grown in the same section different years, are in different condition. Therefore experience only can dictate the exact procedure. But in a word, the base of the whole proposition is two ounces of sulphurous acid to each gallon of pure water. Unless the water is what is usually termed "soft" or has a lack of minerals, distilled water should be used. In any case, water should be boiled before adding the sulphurous acid. To this formula is sometimes added formalin to aid in preserving the natural color of the fruits; it also is a fruit preservative. Glycerin or salt is then added to change the specific gravity of the solution; glycerin anywhere from one to sixteen ounces to the gallon. The point is to make the solution of such density that the fruit will remain suspended without crowding either to the top or the bottom. Mr. Wiggins said that if he were going to handle Shasta County fruit he would have to do so after closest of inspection and watch it after placing it in solution, but he added that it would be wise for you to write the California Promotion Board at San Francisco which should be able to give you more explicit information as to handling of your fruits than could be done at this end of the state.

Chucawalla Valley.

Please give information regarding the Chucawalla Valley. What is the quality of the soil and quantity of water, price of land in different locations, prospects of a railroad and prospects of future development?—Subscriber, Los Angeles.

Chucawalla Valley lies in Eastern Riverside County a few miles from the Colorado River, and as a rule consists of excellent soil. There are some patches of the valley near the foothills in which rocky wash land may predominate. Near the center of the sink is a heavier soil. These soils are all of the nature of a silt deposit, and so far as they have been examined have been reported upon most favorably. It is generally believed that there is no alkali in the soils of the valley. It must be borne in mind, however, that there has been almost no development in this section and no crops have been produced. A company has been formed to lift the waters of the Colorado and carry them to this land in quantity sufficient to irrigate some 200,000 acres or more of land. As to its future or railroad facilities to come, only the wisest of prophets can tell. If water is placed upon the land, without question, it would be a rich empire. Promise is now of the best for conducting water to the land. Assignments have been made on the basis of $3.00 to as high as $10.00 per acre. Excepting a very few cases of state school lands, no direct sales have been made in the valley.

Dying Leaves of Plums.

I send leaves of plums showing brown around the edges. What is the trouble and treatment? Applied a solution of soap to them, but do not know as yet whether or not it will be of any value. These trees were planted last winter from the nursery. —Subscriber, Los Angeles.

The leaves had the appearance of having been burned about the edges and no indication of fungus. We are unable to determine from them what the trouble is, but are sure the "application of solution of soap" would be of no value for this trouble. If the brown appearance is caused by any fungus trouble the Bordeaux mixture would be the best remedy.

Apricot and Peach Vinegar.

Will some reader of the Cultivator tell me how to make vinegar from peelings and culls of apricots and peaches. How long should it stand before straining? Is it necessary to add sugar? If so, how much? Ranchers have enough cull fruit so that this should be interesting reading.—A. L. M., Hemet.

We hope our subscribers who may have had experience along this line will give pointers. We may say, however, that the addition of sugar is unnecessary, though rinsings from syrup kegs, washings of honey separators, and other refuse of that kind will make a valuable addition to the mass of peelings and mashed fruit. Cover the fruit with sufficient water to reach the top and allow to stand until thoroughly fermented when the liquid should be racked off. This liquid should then be placed in a cask which has an opening protected by thin cloth or mosquito bar to prevent access of insects and at the same time permit air to reach the liquid. In the course of a few months it will doubtless make a good grade of vinegar.

Alfalfa Between Young Orange Trees.

Can a 12-foot strip of alfalfa be grown between orange tree rows planted 22 feet apart, without injury to the tres up to the fourth or fifth years from planting?—A. W. S., Exeter.

Alfalfa is not an ideal crop to grow between orange trees for the reason that it requires water more continuously than do the roots of the trees and this prevents thorough warming of the soil. We note you say trees are 22 feet apart and there is to be a 12-foot strip of alfalfa, thus allowing five feet on each side of the rows of trees. This would perhaps be all right for a year or two and plainly would even benefit the soil by turning under roots and tops after making a few cuttings, but we fear the temptation would be to continue the alfalfa too long and thus prevent the fullest development of the young trees. Orange trees require a warm, well-drained soil.

Topping Eucalyptus.

At what time should I cut my year-old eucalyptus row in order to grow straight and strong trees suitable for roadside?—A. W. S., Exeter.

We hardly get the point from the inquiry, but suppose questioner wishes to top back his trees in order to make stockier trunks. When to do it will depend somewhat upon the growth of the trees. For roadside trees the branches should be fairly high so as not to interfere with travel past them. They may be made straight by fastening to strong stakes. As to the season of the year for cutting, would prefer the spring just before they start new growth.

Weevil in Beans.

Please give information as to how to keep bugs from getting into beans. —Subscriber, Pasadena.

The only way to keep the bugs from getting in is to store in perfectly insect tight vessels or bins, but even then some of the weevils may be in the beans when brought from the field. To destroy those which are in the stock at this time the beans may be placed in tight bins and fumigated by using bisulphide of carbon, one pint to 1000 cubic feet. Set in a dish on top of the seed to be treated, close bin and leave for 24 hours or more. Keep light or fire away from this liquid, as it is very explosive.

Grub Eating Asters.

What will kill the insects that eat the roots of asters as they begin to bloom?—Subscriber, Pasadena.

We will ask our subscribers who have had experience to give us answer to the above. We may say that it is extremely hard to handle grubs and other pests of the soil. Any liquid or gas treatment which will cause death of the pests will usually also kill the plants.

Onion Thrips.

What is the trouble with onion tops which I enclose and what is the treatment?—C. M., Arroyo Grande.

The tops have the appearance of being infested with onion thrips. Spray with kerosene emulsion made as follows: kerosene 20 gallons, whale oil soap five pounds, water 10 gallons. Directions for mixing may be seen in Cultivator of November 3, 1910. Application of a very weak Bordeaux mixture is said to be an excellent repellent. By very weak we mean 3-5-50 formula.

Apricot Scab—Smut.

I send couple of apricots, one showing scab and the other affected with a black smut. What is the matter and what should I do to prevent the trouble?—Mrs. L., San Gabriel.

The one fruit scarred with the scab may be treated with the self-boiled sulphur-lime mixture. That works with peaches and doubtless would with apricots, but as a rule this trouble has not been sufficient to call for spraying. The black smut or sooty appearance of the other fruit is caused by black or apricot scale or possibly by aphis which may be infesting the tree. We assume that it is the scale. It should be treated when the trees are dormant by spraying with strong distillate emulsion in a preparation of 12 gallons to 200 gallons of water. This should be applied as soon as the leaves fall.

Amount of Sulphur.

Please give amount of sulphur to use in curing apricots and peaches.—Subscriber, Mulberry.

For apricots approximately five pounds to the ton; peaches, seven pounds. Subject to the fumes about two hours.

Crows Eating Watermelons.

What shall I do to get rid of crows

On the next *Studebaker* Wagon you pass on the road

Why aren't they split and cracked like the ordinary wagon?

Because the ordinary wagon hub is made from oak, a wood that splits and cracks very easily, while

Studebaker WAGON

hubs are made from *Eastern black birch*, a very springy, tough wood, chemically treated, with great weather resisting qualities.

Western birch is used by some manufacturers, but it is even poorer than oak. It is *brashy* and will not stand the strain.

Studebaker hubs cost more than any other hub on the market, but they are stronger and wear longer.

Another reason why you should buy a *Studebaker* from

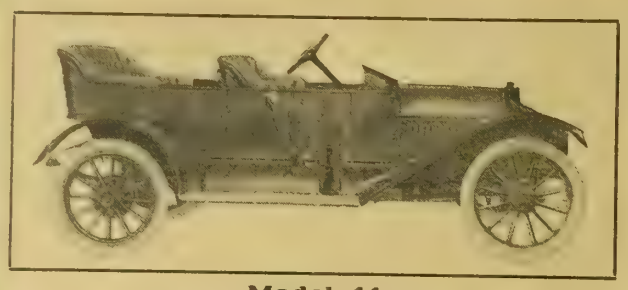
IMPERIAL GUARANTEED AUTOMOBILES.



Model 44

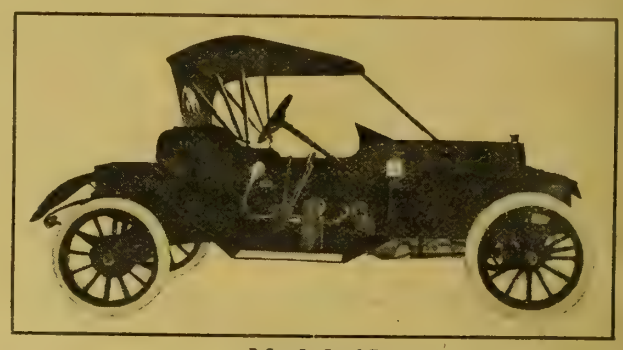
Imperial Models for 1912

Our motto has been "The Get There Kind," and the 1909 and 1910 and 1911 lines of Imperial Cars have become so famous for quiet and beautiful operation, remarkable flexibility and superb hill climbing capacity, that we feel proud to introduce to you our innovations for 1912. Model 43, a snappy and racy looking gentleman's roadster, shown below, without a peer on the market; Model 44, above, our semi-torpedo, five-passenger, fore door touring car, with its graceful and beautiful lines to recommend it to any connoisseur. No expense, time or effort has been spared to produce a highly artistic, practical and refined product. Going beyond outside appearances, Imperial power plants are free from superfluous parts—are capable not only of developing power smoothly, easily and without strain, but with reciprocating parts utilizing every ounce of power when the maximum is needed.

Absolutely Guaranteed

Arnott & Company have taken on the Imperial line as a permanent addition to their other high grade agencies. The high standing of this company attained during the last eighteen years is guarantee that these cars are right in every way. We have eight sample cars on exhibition and solicit the most rigid examination, especially from buyers who are now purchasing their second car and who will recognize the high grade of the "Imperial."

We want an energetic owner-driver agent for this line in each community and can offer a most liberal agency contract that will justify giving us your entire time in selling these cars at a handsome profit. Write today for catalogue and if you are in position to act as agent let us know.



Model 43

ARNOTT QUALITY GUARANTEED ARNOTT & CO. INC. 112-118 S. LOS ANGELES ST., LOS ANGELES, CALIF. ARNOTT QUALITY GUARANTEED

that are eating watermelons? Have tried poisoning, scarecrows, dead crows on poles and all over the field, but everything failed. The only thing that succeeds is a shotgun in the hands of a marksman—Subscriber, Neenach.

We are unable to suggest anything further and will ask our subscribers to help. While the crows in this case seem to be an unmitigated nuisance, there are times when they prove beneficial in destroying insects and small four-footed pests.

Suitable Pears and Figs.

Is there any kind of a pear that will thrive in gravelly unirrigated soil, one that is of some value in the markets?

Is there any fig tree bearing white fruit that is good to dry, that ripens earlier than the Adriatic? This fruit comes along about Nov. first and is almost always spoiled by rain. If there is no white fig, is there a black one that can be dried and disposed of, or sold fresh?—Subscriber, Campbell.

Beurre d'Anjou is a good late pear, large size and was a prolific bearer at the old Pomona Experiment Station on the most gravelly soil they had. The fruit is large and comes in when pears are scarce. Cole is another good pear for sandy soil.

There is no good drying fig besides the White Adriatic except the Smyrna or Calimyrna. The California mission black fig is a good drying fig and is gone two or three weeks before the Adriatic is out of the way. While this fig has not been in favor as a dried fruit until the last few years, it is becoming more popular every year. Last season the packers paid one-half cent a pound more for it than they did for White Adriatic. If quality will cut any figure in the demand for dried figs, the California Mission black fig will stand next to the Smyrna.—J. W. M.

Farmers of the Island of Oahu, H. I., are raising a purse to send an entomologist in search of natural enemies of the Mediterranean fruit fly.

The water level in the artesian belt section near San Bernardino is 4.58 feet higher than last year.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Collecting Wages.

A bales B's hay; B pays A in full for baling. A fails or refuses to pay the men who performed the labor. Can the men collect their pay from B?—Reader, Porterville.

If the men who performed the labor were employed by A and not by B, they have no claim on B.—E. L. P.

Will—Divorce.

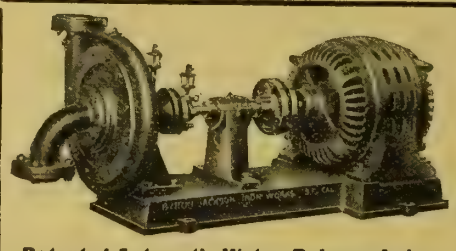
Can a married man or woman will his or her separate property to whomever they wish? How long does an applicant for divorce have to be a resident of the county in which divorce is applied for?—H. H., Lindsay.

Yes, a person married or unmarried, may will his property to whomsoever he desires. The applicant must be a resident of the county in which the complaint is filed for three months prior thereto.—E. L. P.

Filing Rights After Relinquishment.

I have filed a homestead claim of 120 acres, but I find that when surveyed, it does not take in a spring, as I thought it did. I tried to amend my application, but am told by the commissioner that I cannot, as I declared that I had been over and knew the land. Can I give a relinquishment on the claim and immediately file on the quarter sections I want?—Reader, Brice.

I do not find any provision permitting one who has relinquished a homestead to file on another homestead. However, as this is a matter of importance, I would suggest that if the inquirer has any intention of relinquishing his present holding that he first take up the matter with some attorney who makes a specialty of the law concerning government lands.—E. L. P.



Patented Automatic Water Balance Irrigation Pump, direct connected to electrical motor, self-operating, ideal, will require no attention.

The New Way

This is a modern way of irrigating and the one that gives the least trouble. Turn on the switch, and the pump does the rest.

SPECIAL—A choice lot of this season's breeders at $4.00 per trio or in lots of six or more $1.00 each: Drakes, $1.50.

A. E. Nelson El Monte, Cal.

Homesteading.

Is yearly proof of work done on homestead necessary in all homesteading?—B. F. B., Valyermo.

Yearly proof is not necessary in the case of a homestead. To acquire a valid right under the homestead law, the settler must actually occupy the land in absolute good faith with the intention of permanently residing thereon; such occupation must be evidenced by those things which are essential to its beneficial use.—E. L. P.

Protecting Crops from Birds.

Is it against the law of California to kill any but the English sparrows? Is the placing out of poisons to destroy birds permissible?—F. M. D., Covina.

The law does not prohibit the killing of a meadow lark or robin or other wild bird by the owner or tenant of any premises where such bird is found destroying berries, fruit or crops growing on such premises, but the birds so killed shall not be shipped or sold.—E. L. P.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

FARM LANDS FOR SALE.

If you want to buy a small ranch, orchard or large farm, write us, explaining exactly the kind of a property you are looking for.

We deal in farm lands only, and make a specialty of Southern California and San Joaquin Valley farms.

With the hundreds of different farms listed in our office, we are naturally able to find the bargains, and it will pay you to investigate our lands.

If you want to trade your farm for another farm, tell us about it, giving us all the details. We are fully equipped to handle your property.

The James R. H. Wagner Co., 329 South Hill Street, Los Angeles, Cal. Members L. A. R. B.

For Sale—Rancho Summermont of 44 acres, situated in the beautiful and fertile El Cajon Valley, eighteen miles from San Diego. Ranch is improved with 9 room house with good barn and outbuildings, is irrigated with good well and new engine and pumping outfit, and two and one-half inches flume water. Has 12 acres citrus fruits, about 12 acres in deciduous fruit, shade and ornamental trees, with magnificent palm drives. Balance of land is used for grain. This would be an ideal location for a sanitarium, as well as for a private home. For further particulars address Summermont Ranch, El Cajon, San Diego Co., Cal.

For Sale—10 acres in the best section of Rialto, 8 acres 9 year old Navels in the best of condition, 2 acres 3 year old Valencias. Grove must be sold immediately, and is put on the market far below actual value. As a speculation or permanent investment this can't be beat. Only $10,500. $2500 cash, balance $1000 per year at 7 per cent. John W. Shepardson, 215 Katz Building, San Bernardino, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

10-Acre Orange Grove, $1,500 per acre. The best small investment in California. Trees 12 years old, in perfect condition and loaded with fruit. This grove will pay for itself in four years. In best residence section of thriving little city, one hour from Los Angeles. Ripe for subdivision at $2,400 per acre. This is not hot air, but facts. Investigate this if you want a grove. L. F. Anderson, 800 West 47th St., Los Angeles, Cal.

For Sale — Elegant stock ranch, fully equipped, 10,000 acres, in live oak belt. Enough wood to pay for the ranch. Some alfalfa and orange land. Electric cars five miles. 1200 head stock. All this for $15 per acre. Just like finding money. No exchange. H. Kennedy Co., 332 Douglas Bldg., Los Angeles.

For Sale—$4 000. 20 acres. 1,000 young bearing fruit trees; 4,000 eucalyptus trees; 4-roomed house; large elevated spring of water, piped. Chickens and berries do well. Churches and schools convenient. 8 miles from Watsonville. Good roads. P. Gardner, R. D. 4, Watsonville, Cal.

For Sale—$10 per acre; 160 acres good turkey, goat or stock ranch; 4 miles from Escondido. About 100 acres has been cultivated, but now grown up to brush, balance rough. Two springs and good well of water. Old shack. Terms if desired. Address, Conrad & Company, Escondido, Cal.

666 Acre Stock and Grain Ranch, A-1 soil, all under cultivation, good modern buildings, plenty good water, family orchard close to high school. Price and terms on application. F. W. Bartz, owner, Kensal, North Dakota.

For sale or exchange for Los Angeles or Orange Co. acreage. 4 acres in city limits of Santa Cruz, $4000. 5 acres improved home place, $6000. William Richard, owner, 438 River St., Santa Cruz.

For Sale—Cheap. Lot in Tropico, 50x337. Ideal place for chickens. Well located Fruit trees. Piped water on lot. Close to car line. Address, Owner, A. H. Niemann, Tropico, Cal. Phone Glendale 47 J.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—Near Lancaster, Cal. Bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

San Diego County! My splendid weekly newspaper will tell you about this great county and superior climate. 16 weeks for 15c. H. P. Rising, publisher, Escondido, Cal.

Ranch, 640 acres, highly improved, buildings, fruit, alfalfa. $35 acre. L. G. Dawson, Tipton, Cal.

FARM LANDS WANTED.

If you wish to sell or exchange your farm, write to this office, giving all particulars.

Our business is entirely farm lands in California. We have a half a dozen salesmen, all of whom are farmers, and devote their entire time to buying, selling and exchanging farms.

If you want to trade your farm for some other farm, or even city properties, give us all the details—or, if you wish to purchase a new farm or ranch, ask us to send you a list of our different properties.

The James R. H. Wagner Co., 329 South Hill Street, Los Angeles, Cal. Members L. A. R. B.

FOR RENT

For Lease—3 story concrete building, 50x100 feet, on prominent corner of Grand avenue, Escondido, California. Suitable for hotel, bank or store. Will lease ground floor separate if desired. Address, Conrad & Co., Escondido, Cal.

Imperial Valley Fruit Ranch to Let—160 acres in early table grapes, apricots, alfalfa and cotton; 2 miles from county seat. Tenant must have experience, and $3000 capital to furnish labor. Address Horticultural Dept., Box 2, El Centro, Cal.

POULTRY

Lasher's Hatchery, 15 Kent St., Petaluma, Cal.—Why my chicks live and grow in the hands of my customers: They are all hatched from free range stock, bred right, mated right, fed right. I have the most up-to-date hatchery building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks; 16 years in the hatching business, 10 years at present stand. It is no experiment or guesswork with me. Am now booking orders for August and later delivery. On account of time and room, will sell all of my Belgian Hares, 200 breeders, young and old. Write for prices on just what you want.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Our Red chicks are hatching strong, only $12 per 100. Do you want Ancona chicks at $15 per 100 or 18c each? How about yearling males at $3 for Leghorns and Anconas; $5 to $7 for R. I. Reds and Buff Orpingtons? Eighteen Leghorn hens and cock for $20; R. I. Red young cock and four hens, $12; Buff Orpington young cock and four hens, $14. Write for our summer price list. Goodacre Bros., Compton, Cal.

S. C. White Leghorn Cockerels, 3 months old, from roosters of F. Baldwin, San Jose, and one of the best flocks of White Leghorn hens in Petaluma. If taken before Sept. 1, $1.50 each or $12 per dozen; after Sept. 1, $2 each or $18 per dozen. Also Buff Orpington cockerels, $1 each. L. T. Smith, Beaumont, Cal.

Standard Poultry Yards have the thoroughbred Crystal White Orpington Eggs for hatching, in incubator lots or single settings (from the Cook or Kellerstrass strain). Baby chicks from the same strain from one day to one month old for sale. Prices quoted upon application. E. C. Worden & Son, Props., 4004 University Blvd., San Diego, Cal.

Olsen's White Leghorns. Day old chicks and hatching eggs are money makers for you. They lay and pay because they are bred that way. Book orders now for Fall, Spring and Summer deliveries. Address, Olsen's White Leghorn Ranch, Sunnyvale Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Place your order for fall cockerels. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

MISCELLANEOUS

Free—"Investing for Profit" Magazine. Send me your name and I will mail you this magazine absolutely free. Before you invest a dollar anywhere, get this magazine—it is worth $10 a copy to any man who intends to invest $5 or more per month. Tells how $1,000 can grow to $22,000; how to judge different classes of investments; the real power of your money. This magazine for six months free if you write today. H. L. Barber, Publisher, R. 430, 28 W. Jackson Boulevard, Chicago, Ill.

Choice Honey for Sale—At low altitudes honey rapidly absorbs foul gases, which prevent perfect digestion. I keep honey in high mountains, where it absorbs the purest of ozone. Honey as kept in my patent, wax-coated, film-covered cans constantly improves in flavor, digestibility and wholesomeness. If you value health, you should investigate this. C. W. Dayton, Chatsworth, Cal.

For Sale—The Patented Right to manufacture and sell a heat and smudge fuel for frost prevention in orchards and gardens. Better by 50 per cent and cheaper by 75 per cent than any other on the market. No reservoirs needed, no wagon tanks, no pots, no storage houses. Big money maker. For particulars address Otto Anderson, 800 W. 47th St., Los Angeles, Cal.

Send 25c for our latest Bungalow Book, showing scores of beautiful California homes with plans as we build them—direct from Bungalow Land. Home Seekers' Bldg. Corp., 722 Higgins Bldg., Los Angeles, Cal.

POULTRY SPECIALITIES.

KILL BLOOD SUCKERS.
PROTECT YOUR HENS AND CHICKS.
I have discovered a simple, harmless way of destroying and preventing lice. Easily applied, cheap and effective. Postal brings the secret. H. S. Thornberry, Lordsburg, Cal.

TURKEYS.

For Sale—Real Mammoth Bronze Turkeys, one year old. Tom's weight is about 30 pounds. $11 takes the two. Address, 1624 Angus St., Fresno, Cal.

THE SECOND DIMENSION.

It was on a little branch railway in a Southern state that the New England woman ventured to refer to the high rates. "It seems to me five cents a mile is extortion," she said, with frankness, to her Southern cousin.

"It's a big lot of money to pay if you think of it by the mile," said the Southerner, in her soft drawl; "but you just think how cheap it is by the hour, Cousin Annie—only about thirty-five cents."—Youth's Companion.

"Every day is a fresh beginning;
Listen, my soul, to the glad refrain,
And, in spite of old sorrow and older sinning,
And puzzles forecasted, and possible pain,
Take heart with the day and begin again."

Work for some good, be it ever so slowly;
Cherish some flower, be it ever so lowly.
Labor—all labor is noble and holy.
—Osgood.

JEST ASK DAD.

Our fam'ly is the queerest one
  I'll bet you ever see;
There ain't but one in all the batch
  With a good quality.
The rest o' us have lots o' traits,
  But all of 'em are bad,
An' if you don't believe me, why,
  You jest ask dad.

There's sister Kate an' sister Nell,
  Their fault is makin' breaks;
They ain't like pa a single bit,
  Because they make mistakes.
They ought to have been better with
  The trainin' they have had,
But if you don't believe me, why,
  You jest ask dad.

Next comes my sisters, Bess and Sue,
  With fault of too much style;
They seem to think o' nothin' else,
  They talk it all the while.
They keep us in hot water with
  Some fool, expensive fad,
An' if you don't believe me, why,
  You jest ask dad.

Now last—not least—comes Bill an' me;
  Fergettin' is our trait.
It ain't no habit we've acquired,
  It seems to be our fate.
We all take after ma, we do—
  No wonder we're so bad—
An' if you don't believe me, why,
  You jest ask dad.
—John D. Larkin, in Woman's Home Companion.

THE CONJURER.

All around him hummed cheerful conversation, but Mr. Frederic Boyson sat alone and dejected in his corner. Occasionally some one would notice his gloom and address him; but he answered almost sulkily, and soon became the subject of whispered comment.

Only conscious, however, of the fact that Miss Hilda Wenlock had glances and smiles for everybody except himself, Mr. Boyson followed her with a furtive eye. "You never know what to expect with a girl," he reflected helplessly. "She'd lead you on, and encourage you until you were on the point of proposing, and then suddenly, for no reason at all, apparently quite forget your existence. It is enough to make a fellow wish he had never accepted the invitation to her home."

"It'll be quite a mixed affair, Mr. Boyson—mostly young people, and some children."

A mixed affair—yes! Otherwise, he told himself bitterly, a person like Herbert Pinsent, who was leaning maddeningly close to Miss Wenlock as he talked, would never have seen the inside of the house. With set teeth, Mr. Boyson glared in the direction of the couple. His hostess had to address him twice before he heard.

"All alone? Oh, that's not fair. You ought to be helping me entertain people. Let me see, now; what is it you're so clever at? Ah, of course—the very thing."

Mr. Boyson, guessing what was coming, reddened and began to stammer.

"Oh, no, I can't accept any excuses, really," Mrs. Wenlock raised her voice. "Listen, please, everybody. I dare say you've all heard about Mr. Boyson's conjuring. Well, he has promised to show us some——"

He muttered a frantic suggestion.

"Oh, well, then, directly after supper, so that the room can be cleared a bit. Promised to show us some tricks," she concluded trimuphantly.

Mr. Boyson found, all eyes focused upon him, some in pitying superiority, others in contemptuous amusement or polite surprise. He groaned inwardly.

"I won't do it," he avowed—I-I'll say I'm ill, or something."

But Mrs. Wenlock had disappeared, and when at length he found her she laughed at all his protestations.

From then till supper time he moved restlessly about, the picture of misery; and although he sat down to the meal he could hardly eat a morsel. He thought of making a desperate appeal to Miss Wenlock; but she had vanished. At last a maid touched his shoulder to arouse him.

"We've arranged the chairs, sir; and your box has come. And please, the missis says will you kindly see if there's anything more you want."

"N-no," declared Mr. Boyson sepulchrally. "Nothing."

She waited, however, so he rose and followed her.

"A screen, then, if you don't mind; and——er——." He mumbled a confused request.

He could escape directly afterwards, he decided frantically—once the pitiful exhibition was over. Then the house—and Hilda Wenlock—should know him no more. Dully he busied himself in the few preparations necessary. His hostess looked in.

"All ready? Now do come back and finish your supper. You've had positively nothing."

Feebly protesting, he was bustled off again. When they arose from the table he gulped down a drink. The other men gathered around, and made chaffing comments. He scarcely heard what they said. As if in a dream, presently, he found himself facing an expectant throng.

"Of course—er—you all know that I'm only an amateur at—er—the game; and really I didn't want to—that is to say, my tricks aren't up to much—er—at the best of times; and I doubt very much if they'll really come off—so if—so you mustn't expect too much, because—I—er—don't really pretend to—er—I mean—."

Timely clapping of hands led by Mr. Wenlock from the background, served to cover his halting attempt at explanation. He cleared his throat and blew his nose violently. His fingers were curiously unsteady.

"For my first trick—er—I have here an ordinary pack of cards. Will some lady or gentleman kindly select one and—and remember it? Thank you. Now there are three piles; which pile is it in, sir? Again, three piles. The left-hand one? Er—just once more. In the center? I will now deal out; and the card chosen," faltered Mr. Boyson bravely, "should be, if I'm not mistaken—let me tap it with my magic wand—should be the—the eight of clubs."

His heart was in his mouth. A confirming nod made him smile in nervous triumph.

"Right? Aha! the wand never makes a mistake. You'd like to see it again?" An interval followed. "Your card, madam: the two of diamonds — er — should say queen of spades. A slight m-miscalculation."

"Queen of spades it was," confessed the lady shyly. Mr. Boyson grew more confident.

"That little trick, I may say, was taught me by—well, I forget his name for the moment, but—er—my next feat," continued Mr. Boyson hastily, "will be to smash up somebody's watch in full view of the audience,

and then restore it undamaged. The watch—I should like to borrow——"

Sarcastic laughter was general. He explained with difficulty. Mr. Wenlock at last was persuaded to offer his timepiece.

"Now a top hat, if somebody will kindly—thanks. You observe me place the watch inside. Now I will pound it with this mallet. Note—er—note the pieces. We next cover the hat with a handkerchief—so. Hey presto! the hat is empty. Will you pass that ornament off the mantlepiece, sir? Inside we have the w—— the up——."

Mr. Boyson hesitated, staring amazedly.

"The watch; also—also—," he continued jerkily.

"My chain," declared Mr. Wenlock, excitedly. "But I wasn't wearing it. I'd left it in my bedroom. This is marvelous.

Mr. Boyson muttered deprecatingly.

"And it was a full half minute before the entertainer could continue.

"I will—er—now endeavor to change this handkerchief—my own, but quite ordinary; examine it if you like—to change it into something else. I move this screen in front of the empty table—so. Wave my magic wand—so. Any member of the audience like to take the screen away?"

A small boy pressed forward eagerly. At sight of the arrangement of flags there came a gratifying murmur of surprise.

"You can pick them up, my lad. Why—what on earth—."

"My guinea pig!" The applause was almost deafening. Mr. Boyson stared at the animal with bulging eyes, mopping the perspiration from his brow.

"Splendid! Now, how to goodness did you even know we had a guinea pig, much less make it appear like that?"

Mr. Boyson would have liked to answer his hostess' inquiry, but he himself had been only too surprised. "Much better than he used to be," came a whisper faintly from the audience, and he recovered himself with an effort. But when, after balancing an apple on his wand and banishing it to the chimney, he found there the fruit inside half a dozen boxes, carefully packed, he literally staggered. Some queer outside influence was at work.

Such, however, was his success that even a final weakly, humorous episode was well received.

"I will step behind the screen. When it is removed, you will no longer be able to see me. There! What did I tell you?"

Switching on the electric light again, he bowed modestly.

"And that will conclude my entertainment for this evening, ladies and gentlemen. Thanking you, one and all, for your kind attention——"

"Now, do tell us how you did them all."

"My dear Mrs. Wenlock, that must remain a secret, I am afraid. In fact, I—I—er—couldn't explain, really."

"Outsiders wouldn't understand, would they?"

He swung round at the mischievous voice behind him, and met Miss Hilda Wenlock's innocent gaze.

"It was you!"

"H'sh!" she urged, in a whisper. "Wait till they've started games."

Mr. Boyson's heart beat tumultuously. When she slipped out, giving him a backward glance, he followed ecstatically into the deserted hall.

"You've carried it off very well, considering. Thought I'd give you a bit of extra help. It was a great shame for Mother to make you——"

"But how——"

"While you were out of the room I had a few minutes. I knew all your old tricks, of course. Guessed where you had hidden the things, and added a few more."

"You wanted me to make a success of it. You didn't want me laughed at?"

Miss Wenlock cast down her eyes.

"You—you do really care about me—sometimes, then."

Her answer was inaudible. Mr. Boyson, however, began to fumble in his waistcoat pocket.

"Hullo!" She laughed a trifle nervously. "Hey, presto! and what appears?"

"This!" retorted the conjurer, boldly. "Wonder if it'll fit your finger?"

"I knew you'd brought it," observed Miss Wenlock, shyly. "Saw you examining it in the passage. I was looking over the banisters. Some people take things too much for granted! Fancy getting this before you'd as much as asked me—well, you wanted a lesson!"

"So that's why you've been with Herbert Pinsent nearly all the evening?"

"Still, I think," declared Miss Wenlock, nodding complacently, and eyeing the ring with pride, "I think your last trick was quite the best of all."—Journal of Agriculture.

SANDWICH FILLING.

A well-made sandwich with a new kind of filling is something which a hostess may justly take pride in. It is not enough, however, that sandwiches be novel, they must be good to eat as well, a consideration which is sometimes sacrificed for the first mentioned attribute.

Pimentos chopped with lettuce hearts and mixed with mayonnaise makes a good sandwich filling.

Shreaded lettuce with small pieces of very crisp bacon and capers also makes a good filling. For those who like sweet sandwiches a paste made of bar-le-duc and Neufchatel or cream cheese is good.

It is a good thing to remember when serving sandwiches at a formal gathering that chopped or shredded lettuce is much easier on gloved hands than the usual lettuce leaf sandwich.

Minced Ham.

With a cupful of cold boiled ham, minced, mix half a cup of chopped celery and a heaping tablespoonful of minced sour pickle. Form into a paste with salad dressing and spread between slices of white bread.

Fish.

Skin and remove bones from cold fish. Mix, add salt and pepper, two hard boiled eggs chopped and salad dressing enough to form a paste.

Egg and Cucumber.

Chop and mix in equal parts hard boiled eggs and cucumber. Add salad dressing, salt and pepper. Good on white or brown bread.

Olive.

Pit and chop one dozen queen olives. Put to them the same amount of chopped nuts. Mix with salad dressing.

Chopped Apple.

Chop firm, ripe apples of a mild sour. Mix with one-quarter their bulk of grated cheese. Spread the bread, white or brown, with mayonnaise and fill with apple and cheese.

When cooking green vegetables, do not cover the pot in which they are boiled or they will be a bad color. A small piece of common soda, the size of a pea, added to the water, will make them a vivid green.

Scissors and Shears for Every Purpose

E. C. SIMMONS KEEN KUTTER

One of the principal reasons for the wonderful success of the Keen Kutter line of Tools and Cutlery is very careful adjustment. The blades of Keen Kutter Scissors and Shears meet from heel to point without any side pressure of the fingers. The joints remain tight even after years of use.

KEEN KUTTER

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, Aug. 16, 1911.

Butter.

An advance of a cent and a half has been made during the past week and receipts are at present about 60,000 pounds daily. There has been a shortage in offerings of strictly gilt-edged table grades, which makes firmness.

Prices to trade 2½c in advance of the following Produce Exchange quotations:

Extras	26½
Firsts	25
Ladles	23
Country	20

Cheese.

Local Anchor	16
Oregon Daisy	16@16½
Northern Fresh	15@16
Domestic Swiss	18
Imported Swiss	30@32

Eggs and Poultry.

The demand for eggs has been in excess of the supply, especially in the better grades. This has caused a slight advance and more firmness. Some days the receipts only reach 100 cases.

Paying prices f. o. b. Los Angeles are:

Local ranch, candled	34
Case count buying price	30
Northern and Imperial	28@32
Eastern	25@26
Pullets	25

Dealers pay for live poultry f. o. b.:

Hens, per lb	12@14

San Francisco Market

SAN FRANCISCO, Aug. 15, 1911.

Butter.

Considering the season, the receipts are immense. Monday's arrivals totaled 113,800 pounds. Notwithstanding this heavy receipt quotations in fresh stock are held firm. There have been some small sales made a half cent in advance of the following quotations:

California extras, lb	26
Prime firsts	24½
Firsts	24
Seconds	22

Cheese.

Cal. flats	11@14
Cal. Y. America, fy, new	14@16
Oregon, fancy	14

Eggs and Poultry.

Monday's receipts of eggs reached over 3000 cases. On the 11th an advance of a half cent was made on extras, and notwithstanding these heavy receipts present conditions are very firm. Prime firsts and firsts show a more marked advance than extras. A 5-cent advance is noted in the prime firsts.

Official quotations of the San Francisco Wholesale Dairy and Produce Exchange are:

Fresh ranch extras	33½
Prime firsts	31
Firsts	27
Seconds	19½
Eastern seconds	16
Select pullets	25½

Monday's receipts of Eastern stock noted by arrival of two cars. Receipts of local stock very small. Prices steady.

Hens, doz	4.00@9.00

Hay.

Scott, Magner & Miller say:

We have received on this market for the week ending today 4100 tons. A large part of these arrivals came by water and consisted of alfalfa and medium types. The arrivals by car from our better hay districts have been comparatively light for this period of the season, when we should be receiving large quantities from the fields.

The better grades are going rapidly into the warehouses and the fields will be thoroughly cleared of our choice types very early this season, and such hay most probably will command much better figures than prevail at this time.

Feed grains have advanced sharply during the last week. Large operations on purchase account of oats and barley have been going on steadily for the last two weeks, and each day at advanced figures, and at this writing the prices being paid for oats and barley are comparatively very high, but appear to be justified by conditions prevailing, not only on this Coast, but all over the United States. The government crop report, just issued, shows a shortage in the United States on hay alone of 12,579,000 tons. These facts when considered in connection with the crop of hay in California must lead toward the idea of a higher basis of values for our best lots of hay.

The market on alfalfa has continued along in a rather listless condition, and without any decided features to note. Trade here on alfalfa has been light and operations are small for this period of the season.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	15.00@15.50
No. 1 wheat or wheat & oat	12.50@14.00
No. 2 wheat or wheat & oat	11.00@12.00
Choice tame oat	13.00@13.50
Other tame oat	10.00@12.00
Wild oat	9.00@11.00
Stock hay	5.50@6.50
Alfalfa	9.00@11.00
Straw, bale	45@55

Grain.

Wheat	1.40@1.47½
Barley, fancy	1.55@1.56¼
Barley, good to choice	1.50@1.52½
Barley, poor to fair	1.42½@1.47½
Corn	1.60@1.62
Oats, red	1.40@1.60
Rye	1.50@1.60
Mustard, brown	5½
Alfalfa seed	18
Millet	3@3¼
Flaxseed	5@5½
Broom corn seed, ton	25.00@30.00

Feed Stuff

Alfalfa meal	15.00
Bran, ton	28.50@30.00
Feed cornmeal, ton	37.00@38.00
Cracked corn	38.00@39.00
Rolled barley, ton	28.00@29.50
Rolled oats, ton	29.00@30.00
Middlings	32.50@35.00
Oil cake meal	42.00@43.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.00@31.00

Citrus Fruit Market

LOS ANGELES, Aug. 16, 1911.

With immense quantities of all kinds of deciduous fruits filling the markets it is not strange that Valencias are not in keenest demand. As an example of the conditions we may mention that on last Monday the one market of New York absorbed 60 cars of California deciduous fruits. To meet these conditions orange shipments have been materially lessened and it is hoped this will give a stronger tone to the market. Regular sizes of first class fruit still command fair prices, but the large number of small sizes has forced some of them off at almost ruinous prices.

The novel spectacle of Mediterranean lemons being re-shipped from the port of New York to European points has been witnessed during the last week. Extreme weather conditions and lemon shortage has made keen demand which gave promise for bigger returns for the foreigns than could possibly be secured in this country. Prices are now exceptionally good and promise is made for continuation of this condition to the end of the season.

Shipments.

Shipments of oranges to date since November 1st, 1910, 35,162 cars, lemons 5,943, total 41,105. To same date last season: Oranges 24,106 cars, lemons 4,197, total 28,303.

NEW YORK, Aug. 14.—Seventeen cars Valencias and one car lemons sold. Market steady on oranges, higher on lemons. Fair and warm.

THE SPINAL CORD.

A young teacher whose efforts to inculcate elementary anatomy had been unusually discouraging, at last asked in despair.

"Well, I wonder if any boy here can tell me what the spinal cord really is?"

She was met by a row of blank and irresponsive faces, till finally one small voice piped up in great excitement:

"The spinal cord is what runs through you. Your head sits on one end and you sit on the other."

Fire losses are a serious factor affecting the economic conditions of any country. The farmer usually maintains a feeling of indifference toward the dangers from fire, yet according to the records of insurance companies, he is the most seriously affected of any class of people suffering from fire, as farm fires almost invariably result in total loss. Many insurance companies refuse to insure farm buildings and more particularly buildings heated by kerosene flame, such as incubator and brooder houses. This condition of affairs is entirely unnecessary as there are now many appliances on the market that enable even a woman or a child to put out a fire when it is in its early stages. It is with pleasure that we display for the first time the advertisement of the Gorham Fire Apparatus Co. and recommend that all of our readers give this advertisement attention. It is the desire of this company that the farmstead be considered a risk equally as good as the modern city building. This means also to the farmer the safeguarding of his home and is a feature that should not be overlooked. We trust that our readers will apply the old adage, "A stitch in time saves nine."

A most interesting description accompanied by many illustrations of agricultural conditions in Mexico will be furnished to anyone who will write to Ben W. McCloskey & Co., dealers in Mexican lands, at 700 Union Trust Building, Los Angeles. The company has great quantities of land in the state of Sinaloa on which many American settlers have already begun work. Labor may be employed cheaply, and it is said that irrigation is not necessary for securing crops. The section has many of the advantages and few of the disagreeable features of the tropics, and of course it goes without saying that lands may be had at a very low price.

Have Your Own Independent —Water Supply System—

SOIL that will yield crops with a meager supply of water can often be made to yield two or three times as much with plenty of water. Government experiments have proved this beyond a doubt. Just think what this means—more crops—better crops—the choice of crops—all within your reach with the help of an

I H C Gasoline Engine

It will guarantee you a sure water supply—in fact a water supply that is even better than rain as you can have as much water as you need at just the right time. You won't have to wait for rain and watch your crops dry up in the field. An I H C engine is dependable and the cost is so small in comparison to what you can make that the extra profits the first year will often pay for it. In addition to your irrigating this same engine can be used for general purposes.

I H C engines are the most efficient and economical power known for pumping, grinding, and other farm work and are made in so many sizes and types that you can get just the engine you want for your special needs.

Vertical type—2, 3, 25, and 35-H.P.; horizontal—1 to 25-H.P.; semi-portable—1 to 8-H.P.; portable—1 to 25-H.P.; traction—12 to 45-H.P.; sawing, pumping, spraying, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new catalogue.

I H C Service Bureau

The Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problem to the I H C Service Bureau.

Fertilize With Air

The nodules on these roots are colonies of bacteria that suck the nitrogen from the air and store it in the plant, which then becomes a valuable fertilizer. The bacteria were placed there by inoculating the seed with

FARMOGERM
(High Bred Nitrogen Gathering Bacteria)

Science has thus brought the wonderful possibilities of bacteria fertilization to a thoroughly practical and simple method of application.

This places within reach of every grower an enormous increase in the tonnage and fertilizing value of

COVER CROPS

Vetch, clover, fenugreek and all legumes can be inoculated with Farmogerm at a nominal expense and by a simple operation, or we will treat the seed for our customers if preferred.

Chico, Cal., July 26th, 1911.

Frost Prevention Co.,
San Francisco.

Dear Sirs:

In reply to yours of the 25th would say that there ought to be good sale for the Bolton Orchard Heater this year as they have proven a success during last spring's frost. I have used the heaters four years. In 1908 I had 80 per acre in apricot orchard, none in the almond orchard, just across the road. There was no sign of frost in the apricot orchard, and the almonds froze off clean. This year (1911) I had the heaters in the almond orchard and none in apricot. Apricots froze clean except a few in tops of trees 18 or 19 feet from ground. No sign of frost in almond trees. N. C. Jessee and A. Gee both used heaters with the same result. These three orchards contain nearly all the almonds for quite a large scope of country. I think this proves all you claim for the heaters. There was no need to use them in 1909 or 1910.

Yours truly,

(Signed) H. Losee,

BEAR CREEK ORCHARDS.
W. S. Brooke, Manager.
Medford, Oregon, U. S. A.,
July 25, 1911.

The Frost Prevention Co.,
San Francisco, Cal.

Gentlemen:

Replying to your favor of the 18th inst., beg to state that we used about 3,500 of the Bolton Orchard Heaters during the past season and though there were several mornings that the temperature was as low as 24 degrees, we pulled out a crop of about thirty-five carloads from fifty acres. There were seven mornings, any one of which would have practically annihilated our crop had we not been equipped to fight the frost. We expect to equip another fifty acres for the coming season, and while we dreaded the magnitude of the undertaking, one hundred acres does not look as large to us now as fifty did before we undertook it. Yours very truly,

THE BEAR CREEK ORCHARDS.

The Frost Prevention Co.,
San Francisco, Cal.

Dear Sirs:

We used the small heaters for three evenings. We did not have the frost that we sometimes have, but cold enough that all blossoms where we did not use the pots were killed. We only lighted every third pot, which raised the temperature six degrees. Six hours has been the limit as to time of burning them. We used fuel oil from the Standard Oil Co. We have just tried an experiment with the crude oil from the well, as we have several wells of our own, and find that it burns equally as long as this fuel oil. Yours very truly,

H. A. ALBYN.

Frost Prevention Company,
San Francisco, Calif.

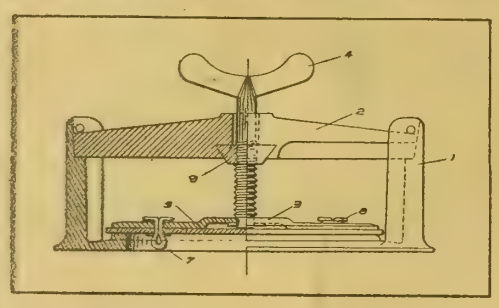
Gentlemen:

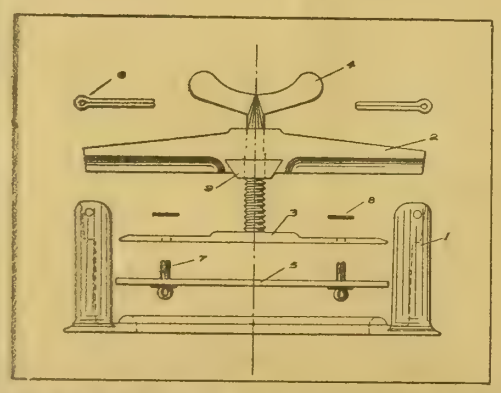
In reply to inquiry from your local agent, the writer begs to advise you that three thousand of your two-gallon Bolton Smudge Pots were used in his orchard during the past spring and were eminently satisfactory. While the cold weather here was not excessive, still the writer lit about one-third of the pots on three nights and found that number ample to control the temperature in his 45 acre orchard. By actual test, the pots burned from eleven to thirteen hours, according to the wind conditions. The writer selected this pot after testing out several of the most prominent makes.

Yours very truly,

(Signed) A. HANNY.

POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

Do California Fruits Need Protection?

In a Trip to Southern Europe, G. Harold Powell, of the Citrus Protective League, Sees Things, and Gives to California Lemon Growers Some of His Impressions

During a recent trip in Italy and Spain several things were observed in connection with the orange and lemon industries which are of interest to the California citrus fruit grower.

The European Demand for Citrus Fruits.

There is a steady increase in the demand for oranges and lemons in European countries, especially for fruit of the higher grades. The exports of lemons to European countries have increased proportionately faster than to the United States during the last ten years. The exports of lemons from Italy have increased about 80 per cent in the last ten years. The exports to the United States increased about 75 per cent during the same period of time. The exports to Denmark increased approximately 3820 per cent, to Germany 250 per cent, to Switzerland 225 per cent, to Belgium 230 per cent, and to Norway and Sweden 210 per cent each during the same period of time.

The increase in the demand for lemons in Europe has raised the price of the fruit this year, Palermo exporters having to pay from five to ten dollars per thousand fruits laid down at the packing house during the last few months. No systematic efforts are made by the Italian exporters to develop the European trade, but it is the opinion of the leading exporters there that the foreign demand will increase even more rapidly in the future than it has in the past.

Tariff Causes No Increase.

The highest priced lemons are exported from Italy to Russia. All of the countries of Northern Europe receive grades similar to those that are shipped to America. It is interesting to know that in some of the countries that use Italian lemons exclusively where there is no tariff duty, and a freight rate of only about 30 cents per box, the retail price is practically the same as the retail price in the United States. The exports of lemons from Italy in 1910 were approximately 569,000,000 pounds, or the equivalent of about 20,000 California carloads.

The Spanish Orange Industry.

There are a billion pounds of oranges exported annually from Spain, half of which are consumed in the United Kingdom. There are probably a hundred thousand acres of oranges in Spain located mostly on the eastern coast in the Valencia province and in adjoining areas. The Spanish crop is marketed during the same period as the California navel crop, i. e., from October to June. The groves in Spain are under irrigation and intensely cultivated. In some sections like Alciras and Carcagente, the groves are cared for as well as the best groves in California. The pruning of the oranges is much more systematically done there than in California. The trees are more open and spreading and with much less fine wood than is to be found in a California navel or Valencia tree. The trees are generally headed three to four feet from the ground. The Spanish grower gives more attention to the individual tree than we do. An ailing tree is carefully examined, the roots are bared, and a root that is out of condition is cut off and removed. In many of the better groves, the soil was removed from the base of the tree, so that the hand could be extended under it. The large roots were exposed two feet or more from the body of the tree. A ridge of soil was raised around the basin to prevent the water touching the crown of the tree, thereby reducing the danger from root diseases.

The increase in the demand for lemons in Europe applies equally to oranges, the Spanish grower receiving this year about 20 per cent more for the fruit than for several years past.

Labor and Transportation Conditions.

The cost of labor in Sicily varies from one-fourth to one-third of the cost of similar labor in California. In Spain the labor is still cheaper. An ordinary man laborer is paid from 45 to 70 cents a day in Italy. Special kinds of labor are sometimes paid as high as 80 cents or even $1.00 per day. An ordinary man laborer in Spain is paid from 40 to 50 cents per day, the usual wage seldom running over 45 cents.

About one-third of the agricultural laborers in the citrus fruit district of Sicily are women. Women are also used largely in the packing operations in both Spain and Italy, the wages of women varying from 15 to 30 cents per day.

A considerable proportion of the labor is also made up of boys from 10 to 16 years of age. These boys are used both in the groves and packing houses, and are paid the same rate of wages as the women.

The cost of shipping a box of lemons from Italy to the United States is about three-elevenths of a cent per pound. From Spain to the principal distributing centers in Europe, the freight rate is still less. Sometimes it is not over a shilling a case; the case holding about two and one-half California boxes. This would equal a rate of about 10 cents a California box for the cost of transportation. From California it costs one cent per pound to transport the lemons to the principal centers of consumption and $1.15 per hundred pounds to transport oranges, plus the refrigeration charges on a considerable portion of the crop.

The Citrus Marketing System in Italy.

The citrus industry in Italy is founded on the speculative method of doing business. There are a few speculative exporters in Palermo who handle the bulk of the crop. There are a few speculative importers in New York who handle the crop in this country and whose interest and often whose identity is identical with the exporters of Italy.

There are a horde of small brokers in Italy between the exporter and the land owner. Five different profits or commissions are frequently included in the F. O. B. value of a box of lemons in Palermo. It is seldom that less than three profits or commissions are included in this value; the profit of the land owner, of the renter of the land, and the commission of the intermediate broker between the producer and the exporter, or of two brokers, where two frequently exist. The grower has nothing whatever to do with the marketing of the fruit.

Under the speculative system followed in Italy, there are no comprehensive marketing plans developed, the marketing following the usual course of speculative trade practices. When a dozen Italian lemons finally reach the American consumer, the latter pays from eight to eleven commissions or profits in the retail price. There is a wide difference between the price the consumer pays and the price the producer receives, the latter receiving from one-fifth to one-fifteenth of the former price.

System Not Good.

The present system of distributing and marketing the Italian lemon crop, both in Italy and in the United States, is similar to the method which brought general disaster to the California citrus producer fifteen to twenty years ago, and which led to the present comprehensive system of distribution and marketing.

The speculative system now in use in the Italian lemon business brought disaster on the Italian citrate of lime business, which is a department of the lemon business, and caused the government to take the marketing of the product out of the hands of the speculative interests and to establish through the Camera Agrumaria, in 1908, and by supplementary legislation in 1910, a government monopoly. Through a commission, the government fixes the minimum price to be paid to the producer for the citrate of lime, into which 40 per cent of the entire crop is converted, the minimum selling price also, and it markets the product for the producer.

The speculative system is said to have brought the lemon essence industry to a similar condition, and efforts are under way to induce the government to extend the authority of the Camera Agrumaria to the essence trade as well.

The Decay in Oranges in California in 1911.

Early in the present season the Citrus Protective League requested the United States Department of Agriculture to investigate the unusual decay that was then developing in oranges while in transit. It was believed by many of the shippers that the decay was due to the condition of the fruit and to the season.

A number of investigators were sent here by the department and a comprehensive investigation of the relation of handling methods practiced by the growers and shippers in 1911 to decay was made. A circular has just been issued by the Department of Agriculture, entitled "The Relation of Handling to Decay in California Navel Oranges, Season of 1910-11." The work of the Department of Agriculture corroborates the results of the earlier work in every respect, and shows that the decay is primarily the result of improper methods of handling the fruit.

In a season like the past, the fruit may be more susceptible to decay than in other seasons, but the work of the department shows "that even under unfavorable conditions, which prevail during the season, fruit may be handled with sufficient care to insure its sound condition on arrival at market."

Every grower and shipper should send to the United States Department of Agriculture, Washington, D. C., for a copy of this circular.

The Lemon By-Product Industry.

About 40 per cent of the Italian lemon crop, or the equivalent of 20,000 California carloads, is converted annually into citrate of lime, lemon oil, and other by-products. One-third of the citrate, and about one-third of the oil is imported into the United States. There have been many attempts to establish a lemon by-product business in California, but up to the present time the efforts have not been commercially successful. Practically all the work in Italy is done by cheap hand labor.

In order to establish a by-product business in California methods will have to be worked out by which we can accomplish economically by machinery the results now attained in Italy by hand. The league is therefore interested in having established in California an experimental laboratory by the Department of Agriculture, through which the government and the industry can co-operate in an

Citrus and Tropical Fruits

THE ART OF BUDDING.

By G. Ross Robertson, Mentone.

The article of my neighbor, Mr. C. R. Paine, on the renovation of the Australian navel leads me to offer a few suggestions in the line of citrus budding and especially topworking. Such suggestions may not prove of much value to a professional budder, principally because this sort of propagator has become adept enough in the art of the thing to cease bothering about the science of the operation. For the small grower, however, especially one new at the business, it may be a matter of interest to be familiar with the various details of budding on a small scale. Almost any grower of Washington Navels has occasion at times to remodel odd trees in his orchard, but considers it not worth while to call in a professional budder.

There seems to be a considerable percentage of fruit growers, and especially amateur gardeners, that look upon budding either as a solemn mystery or as an art to which a man must be born even as some sort of genius. Or perhaps we are told that it is purely a matter of luck whether or not "the buds take." In the midst of such sentiments, and with lots of other work to do, the grower in question drops his budding practice in disgust after his first magnificent failure.

It is not the point of this discussion to elaborate on the material used in the process; any good horticultural work will discuss that amply. In most of these works, however, the operation of placing the bud is passed off with the simple phrase "insert it," leaving the reader to guess how much bark to unpeel while he makes room for the bud-shield. Some writers advise the use of the flat bone or ivory tip of the budding knife to accomplish this purpose; others again warn the novice that he must not risk damaging the delicate bud by making it force its way under previously undisturbed bark. Such rules are all very well in their general application to the plant kingdom, or at least in cases where the buds are very tender and the bark tough or clinging. With citrus trees, however, the operation of lifting the flaps of bark with the knife is entirely unnecessary and, as in other plants, prejudicial to success. A higher percentage of "takes" will be to the amateur's credit if he uses the freshly cut bud-shield as a wedge to plow its own opening beneath and to the sides of the downward slit. A properly selected citrus bud is a comparatively tough piece of plant tissue. Any citrus stock which will not allow its bark to "slip" readily enough to admit the bud unbruised, is in no decent condition to bud any way. It seems to be of little importance whether the bud is slipped up or down from the cross slit, although it is considered by some a better practice to work from the bottom up.

At any rate we must again break away from the old country rule which says that the cross slit should be made straight in, at right angles to the stock. The right angle cut theoretically heals over quicker, but as a practical matter does not permit of insertion of the bud without previously lifting both flaps of bark with the tool. A slanting woodchopper's cut, sloping in the direction of the final position of the bud, allows the wedge point of the bud to slide down and eventually into place, even though the bark be quite thick. Where old trees are being top-worked, the operator will find that he has to deal with bark many times thicker than that on nursery stock; and it is here especially that the slanting cut proves of value.

An examination of the mode of heeling-in of buds will, I think, show the scientific value of slipping or wedging the bud as against the bone-handle method. Most of us are familiar with the fact that when growing bark is lifted, a longitudinal break is made through the central portion of the cambium or vegetative layer. The cambium is of course composed of delicate new-made cells, some of which have clung to the peeled-up bark, others to the wood proper, showing in both cases a yellow or cream color surface of slimy texture. A great many people seem to disregard the fact that the peeled bark retains a useful portion of the important cambium layer, thinking that it is necessary to adjust a bud to the wood-cambium only. On this principle it becomes only an incident that the bark flaps are folded down over the bud, as though they were "there because they were there."

Now the bud itself, if cut with a piece of its own wood attached, has both a bark-cambium and a wood-cambium layer, lying adjacent and undisturbed, The wood-cambium finds, on being slipped into place on the stock, a surface suited for immediate attachment; but the bark-cambium of the bud does not touch a corresponding surface if the bark of the stock has been torn up with a knife for some distance around the bud. It is a familiar fact that when the bark of a stock has been peeled up for any distance, the healing or callusing process starts at the point where the peeling stopped, i. e., at the farthest point from the bud. The soft callus tissue now works its way inward, finally reaching the bud, where it has an opportunity to unite with the bark-cambium of the bud. It is right here that so many failures in budding show up.

If the bud is not vigorous, or if there is a scant sap flow to keep it alive while the callus is traveling in its direction, the operation obviously cannot succeed. On the other hand, picture the condition where the bud has been forced to peel up the bark of the stock itself. This bark is only lifted at the point where the bud actually sits; the necessary callus growth is ready to start at once close in about the periphery of the bud section, and the union is successful. The same idea suggests other precautions:

In using the entering bud as a wedge, don't be so clumsy as to "wiggle" it about under the bark, thereby disturbing a large area of cambium. Make a single, straight, drive home, with no side trips. Never pull the bud back over the track over which it has been pushed; such an action only hinders callus tissue from reaching the bud tip; due to the presence of the hole from which it has been pulled.

Cut the bud slightly longer than the longitudinal slit in the bark of the stock; as the bud is slid along it will be forced to squeeze its way very

NOTICE

To Users of

FUMIGATION CYANIDE

Quality is the Important Consideration

Do Not Be Deceived

Should someone offer you so-called Cyanide of Potassium at a price below the market, it is safe to assume that it will prove to be a

Low Grade Sodium Cyanide

carrying from 7% to 15% of Sodium Chloride. **Such cyanide bears no manufacturer's brand or label.**

It is Your Right to Receive an Analysis

The new State Law governing the sale of insecticides and fungicides provides that an analysis be printed or pasted on each case or package of such material. This law was framed by the agricultural department of the University of California; you should receive the protection it is intended to afford. INSIST ON AN ANALYSIS.

If any doubt exists of the correctness of analysis furnished you, send a sample of the material to the Agricultural Department of the University of California, which will analyze it for you for the nominal fee of $1.00.

Fumigation with Cyanide involves a heavy outlay of money and (when inferior chemicals are used) too great a risk as to the effect on citrus trees, and the condition of the fruit, for any grower to remain uninformed on this subject, when authentic facts compiled by the United States Department of Agriculture may be had on application.

Bulletin No. 90, parts 1-2-3, of the United States Department of Agriculture, Bureau of Entomology, on "The Fumigation of Citrus Trees," "Chemistry of Fumigation with Hydrocyanic-Acid Gas," "The Value of Sodium Cyanide for Fumigation Purposes" are publications which should be read by all growers who have any interest in the extermination of the several varieties of scale.

READ WHAT PROF. R. S. WOGLUM OF THE UNITED STATES DEPARTMENT OF AGRICULTURE SAYS:

"Past experience in this state with a 98-100 per cent. SODIUM CYANIDE has proven unsatisfactory. Why? I will tell you the reason.

Chemical analyses have shown that practically all commercial potassium and sodium cyanide contains more or less common salt, which is technically spoken of as sodium chloride. The action of this salt in connection with fumigation demands consideration. It has been found that when sodium chloride is present in the reaction of sulphuric acid on a cyanide in the production of hydrocyanic acid gas that this chloride salt produces a secondary reaction which liberates an acid called hydrochloric acid; that this liberated hydrochloric acid immediately attacks the liberated hydrocyanic acid gas and decomposes it to a great extent. Hence, as the presence of sodium chloride in a cyanide produces a partial decomposition of the hydrocyanic acid gas when liberated, the ultimate result is that less gas is given off than from a cyanide of the same degree of purity which is free of it. The extent of the decomposition depends upon the amount of sodium chloride present. That this might be great is shown by the results of one experiment performed by the United States Bureau of Chemistry in which the decomposition amounted to little over 92 per cent of the total gas, only a little over seven per cent being evolved."

CONDEMNED AS UNFIT FOR USE.

"The results of these experiments bring to our attention a second consideration in the purchasing of a cyanide. That a cyanide be of a certain grade of purity is no longer the only consideration.

"It is of equal importance that the cyanide be practically free of sodium chloride. **I would condemn as unfit for use in fumigation any cyanide containing in excess of one per cent of sodium chloride.** Returning to the high grade sodium cyanide, it was found that this as well as the high grade potassium cyanide, contained only a fraction of a per cent of sodium chloride. It generally can be held as a safe consideration that a cyanide approaching chemical purity will contain not more than a trace of sodium chloride and that such a cyanide generally can be safely used, even though the degree of cyanide purity is alone known. I would consider as generally satisfactory for fumigation, a potassium cyanide 96 per cent or above, or a sodium cyanide 124 per cent or above. Chemicals of lower purity should never be used. Preferably the grade demanded should be a little higher than that given, or a potassium cyanide 98-99 per cent."

The Kind of Cyanide to Use

The Roessler & Hasslacher Chemical Co.'s Guaranteed Cyanide of Potassium (98-99 per cent) and High Test (128-130 per cent) Cyanide of Sodium are manufactured expressly for fumigating and contain no reactionary chemicals. The manufacturers of this material have studied the requirements necessary to produce definite and dependable results.

IT GENERATES QUICKLY, affording the required degree of density of gas under the tent.

CONTAINS NO CHLORIDE OF SODIUM, insuring the highest efficiency and maximum evolution of Hydrocyanic acid gas.

To the Water Well Owners and Drillers of Southern California

We beg to introduce ourselves and ask for a chance to prove worthy of your permanent confidence and patronage.

We have found that with some additions, the complete line of oil well supplies which we carry at Los Angeles and in our branch stores, is admirably adapted to supply the needs of the water well trade, and we are entering this field with all the vim and vigor which have built up our immense oil well business in the past five years.

If you are in need of an engine, pumping outfit, casing, belting, tools (small or large), pipe, fittings or supplies of any kind, we will be more than pleased to serve you. You will find our goods of the better grade only, our delivery prompt, and our prices the very lowest, consistent with first quality.

We will take pleasure in supplying any quotations or other information you may desire and will appreciate an opportunity of making your acquaintance.

Ask for our special bulletins on water well supplies. Mailed free.

MELILOTUS CLOVER

The Favorite Cover Crop

This most wonderful of nitrogen gathering plants possesses also the advantage of a deep root system which brings up the potash and phosphorus in dense soils. As a producer of humus and nitrogen for orchards it has no superior. Alkali land is made rich and productive with a few crops of Melilotus clover.

Planting season is near and the prices on our splendid, fresh, recleaned seed will be attractive to you.

We carry full stocks of all other cover crop seed—Vetch, Burr Clover, Fenugreek, Peas, Beans, etc. Write for prices and further information.

Farmogerm is a practical culture of nitrogen gathering bacteria which is easily applied and will increase a cover crop fifty to two hundred per cent. Our booklet on this subject is intensely interesting—write Dept. C for a free copy.

tightly under the bark at the last quarter inch or so of the journey. Such a method will promote the good union of the bud tip. On the other hand, if the slit is cut for an indefinite length above or below the bud-tip, an unnecessary wound is made, allowing entrance of air or water.

Use well matured buds only, of course; but select those with wide bases of shields. A high, narrow and angular bud will lift thick bark so high that an undesirable cavity will be formed all about the bud, preventing the quick arrival of the callus growth. This note is of course applicable to budding large trees rather than nursery stock.

Finally, don't forget to use good waxed tape or cloth. Cover up the whole scene of operations, bud, slits and all. And don't start to bud at all until your knife is just a little short of razor sharp.

STATE WORK IN THE SOUTH.

We have from Prof. E. J. Wickson outline of the work of the Southern California Pathological Laboratory and the Citrus Experiment Station, and suggestion of work cut out. The work in the southern part of the state was recognized by the legislature of 1911 by granting $25,000 for the purchase of land and erection of buildings at the Riverside Citrus Station, also $4000 appropriation for the enlargement of the laboratory at Whittier, with another $3400 for barn, laboratory equipment, heating, furnace, etc. These sums are in addition to the usual legislative appropriation for maintenance. For this branch of the work the appropriation is $15,000 for the period of two years. It will in part be used for extension of research and experiment in the Imperial Valley. Regarding other work contemplated by the Station, Prof. Wickson writes:

"Work will be continued upon the "Brown Spot of the Orange" in an endeavor to obtain further knowledge in regard to the cause and means of control of this very obscure and troublesome disease. Investigation will be carried on upon a considerable scale in connection with the various more obscure diseases causing the deterioration of lemons. Such troubles as the "Red Rot," "Black Spot," "Pitting," and other similar effects upon the rind of the fruit will receive attention. Also certain fungus decays which are not yet thoroughly understood, particularly those caused by the so-called "Cottony Fungus" of the form known as "Gray Rot." Our investigations concerning the English Walnut, which have gone on for several years, will be continued, particularly along the line of developing and testing new varieties. In this work the object has been to obtain varieties more or less immune to the walnut blight and also having desirable commercial qualities. Other plant disease investigations will take up the matter of vegetable diseases, particularly those affecting the tomato, sweet potato and watermelon. All of these crops are troubled with serious and destructive pests. Study will be continued upon the "Crown Gall," one of the most serious diseases affecting fruit trees in this state. Such work will consist both in the study of the organism causing the trouble and its relation to various trees, and also work from the nurseryman's standpoint in connection with the possibility of growing trees immune to these diseases.

"In entomology work will be continued along the line of special studies upon citrus tree insects. In pomology considerable work is under way in connection with improving fruit varieties by selection, particularly in the case of citrus fruits, and also in introducing and propagating desirable new fruits for Southern California. Investigations are also being conducted upon the life history of our citrus fruits in connection with various questions affecting the development and nature of the fruit. It is proposed, during the coming year, to commence a special investigation of the relation of the citrus tree to soil conditions as affecting the health of the tree and the production of the fruit. This study will be carried on partly from the standpoint of the soil and partly from that of the tree. It will therefore involve the services on the one hand of the soil chemist, physicist and bacteriologist and on the other hand that of the plant physiologist.

There will also be continued soil investigations already under way in regard to soil fertility and treatment. This concludes the list of specific subjects of investigation, but in addition to those the Southern California stations will continue as in the past to carry on a large amount of other work of a routine or general nature in the way of minor investigations, field studies and examinations and handling of correspondence."

PROTECT CITRUS FRUITS.

(Continued from Page 169.)

investigation of these complex questions. It is probable that such a laboratory may be established here this fall.

Soil Conditions in the Citrus Industry.

The Citrus Protective League is also interested in having some of the orange and lemon troubles that appear to be related to the soil investigated by the United States Department of Agriculture, the investigations to supplement the extensive studies already in progress by the State University. As a preliminary step in this direction, the department has sent specialists to California to look over the ground and to determine whether the problems which confront the industry are of such a nature that they can be investigated by the department in such a way as to make the work supplementary to the investigations already in progress.

TWO KINDS OF FARMERS.

The Cultivator is in receipt of an article unsigned other than "H. A. H., San Bdino," which has to do with two kinds of farmers. It is a very good presentation of the contrast between the modern, up-to-date, brainy farmer and the "man who goes around with a long face, kicking because his crops are not a success, but has not the get-up and go to investigate and find causes. He is never ready to harvest crops when they are ready for him. His fodder gets too dry; his alfalfa blossoms and loses many leaves, etc." At the end the writer concludes that while the kicker lays his lack of results to luck it is in reality due to lack of brains which his more fortunate neighbor possesses. We do not believe it is a question of lack of brains so much as not utilizing those he has. All told, the article is a good one, but we wish to take issue with the writer in that he failed to sign his name. He also wrote on both sides of the sheets of paper. That is readily excusable, but the not signing of names to communications is so common that we take occasion to once more call attention to it. Many firms have a rule of looking first for the signature to a letter, and in its absence it promptly goes to the waste basket. This treatment of anonymous letters is entirely proper and must be understood by practically every one, yet scarcely a day passes but this office receives such communications. As we have said dozens of times, where one wishes his name withheld the wish will always be respected.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

TWO KINDS OF SMITHS.

In a certain farm neighborhood in Wisconsin there once lived two farmers. Their farms joined, as the saying is. Both of the owners were named Smith, although they were unrelated. But they and their farms were so totally unlike that the neighbors fell into the habit of designating them as Slow-to-catch-on-Smith and Quick-to-catch-on-Smith. Finally for the sake of brevity, they were called Slow and Quick Smith. The fact that their lives and methods of farming were so typical of two distinct classes of farmers makes a brief study of the two somewhat instructive as an example of how the mind makes the man and finally the farmer.

Both men were raised in Pennsylvania of good old German stock, yet what a difference there was between them! Both came to Wisconsin after the Civil War and, so far as we can learn there was but little difference in their means at the start, except that Slow Smith had money enough from his father's estate to nearly pay for 160 acres of land while Quick Smith started with 40 acres paid for with money he had saved as a hired man.

Quick Smith always declared that he owed his success to the fact of having worked for ten years with one of the best farmers in the old Keystone state, a man who was a bright, well-read farmer in every respect.

Neither of the Smiths had any education beyond that of the country district school where they barely learned to read, write and cipher as far as decimal fractions. But after 25 years of living side by side, the contrast in their circumstances, in their intelligence, in the character and method of their farming, in their farm houses and other buildings and the fertility of their farms, as well as the quality of their live stock, was so marked as to become a matter of general comment.

After studying them awhile one day, we made up our minds that the neighbors had struck the secret and reason of this difference in the names they had applied to them. Slow Smith was truly slow in everything. He had learned but little since he got his first ideas of farming from his father. He was so conservative, so slow, that he was suspicious of every improvement, every new idea, every new kind of a machine so that it was noticed that he was about ten years behind his neighbor in the adoption of any change for the better and then most of the time he would do the thing in a botchy, half-way manner, showing that he did not comprehend the principle of the thing.

On the contrary, Quick Smith was always on the alert to study out some better way of doing things. He was a great reader on farm questions. This habit he learned from the man he worked for so long in Pennsylvania. Then, too, he had a quick, active mind, and he kept it active and strong by feeding it with progressive ideas.

Originally the quality of the soil of the two farms was about alike, a strong clay loam which readily responds to good treatment.

Slow Smith had a great contempt for reading farm papers and books. He used to say that "he didn't want any book farming in his," that the other Smith wasted too much time and money and that sort of thing.

Now all this time Slow Smith's farm was running down. He made no study of the soil, for he shut out all light from his mind on that subject. He ascribed the failure of his crops to the bad seasons. His cattle were of the same scrub stock he started with, except that he would occasionally buy a cheap grade Shorthorn bull. He said "Shorthorns were good dairy cattle for him." He was in debt to the extent of a $3000 mortgage on his farm.

Quick Smith was the exact opposite of Slow Smith. He had a splendid herd of grade Jersey cows, for he had always bought the best bull he could get, paying at one time $350 for one exceptionally good bull. He had a big machine shed filled with the best improved machinery, for he said "man help is scarce and high and we must do everything by horse power and machinery we can." But he took good care of his machinery. Slow Smith didn't. You could find plows, mowers, horse rakes, and a reaper, even, out in his fields, all winter long. He said he couldn't afford to build a shed.

Now to sum up—Quick Smith owns a 250 acre farm, well stocked, in fine condition, with splendid buildings, plenty of machinery and $2500 in the bank and he owns the mortgage on Slow Smith's farm. He has never said that he "couldn't afford" anything that made for the betterment of his farm.

Slow Smith has always followed the idea that he "couldn't afford" this, that or the other thing. "Get along without it as long as you can" has been his maxim. He can't afford papers or books. "They are no good," he said. Slow Smith has practically wasted his whole life. He has grown smaller in mind and fortune.

Quick Smith has gone ahead, built up his mind and judgment with good ideas; and good ideas, put into practice, have made him the man and farmer he is today. Both men represent two classes of farmers.

Now just a word as to the cause of these two widely differing results. There is a cause for every result. What made Quick Smith prosperous? The use of his mind. He proposed in the beginning to gather to himself all the useful knowledge he could get.

He could look around him and see the effect of poor farming everywhere. He could see just as well that the most successful farmers were the ones who made use of the best knowledge. So he proposed to get that knowledge. Part of it must come through reading. So he became a reader, and as he read, and studied, and worked, he grew in knowledge.

It is no new way. It is the way every man who succeeds in anything must travel in. His mind became quick to perceive right principles and right methods.

Why was Slow Smith so slow? Because he had educated himself by lack of knowledge to be slow. All unconsciously he had trained himself to think slow, work slow, and be slow. His mind was blank, empty of right knowledge. It was like his soil, losing the power to produce. In both soil and mind, where we put nothing in we will take nothing out.—Hoard's Dairyman.

CERTIFIED BUTTER.

Provision Now Made for It by the State Law.

Leon M. Davis, in the Pacific Dairy Review, says:

"One of the bills passed by the State Legislature this spring was an act permitting medical milk commissions to draw up requirements under which 'certified butter' might be produced. This matter has been taken up, to a certain extent, in the bay cities, and there is at present some agitation stirred up regarding it. There may be those who are not familiar with the movement, and for these few the following notes on the matter may prove to be of interest.

"In the first place, what is a medical milk commission? Some years ago the matter of pure milk production was taken up in some of the larger cities, with the result that a board of commissioners was created, in whose power it is to certify as to the cleanliness and composition of dairy production. The work of the medical milk commissions so far has been devoted largely to the production of certified milk, and has been very successful along this particular line. At present there are several dairies in this state producing certified milk.

Certified Butter.

"Now, by the act of the recent legislature, it is within the power of such a commission to draw up requirements for the production of certified butter. This should not be interpreted as a compulsory act. It is not, but any creamery may take up the work. If it is desired to manufacture certified butter, the creamery must live up to certain requirements made by the commission, and it in turn will receive the certificate of the commission, which will be a guarantee as to purity of product. Thus we have the term 'certified butter.'

Requirements.

"Of special interest to the creamery man are the requirements which will be made to get the certification of the commission. The object of the entire movement, of course, is toward securing an absolutely pure article. Those of us who are at all familiar with the cream supply of today are aware of general conditions and that there is room for improvement. Every requirement made will be toward that end. A set of proposed requirements which was submitted to one of the milk commissions by originators of certified butter provides as follows:

"First—No cream shall be made into butter which is more than forty-eight hours old at the time of delivery to creamery.

"Second—Cream from which the butter is made shall be pasteurized in one of the following ways: First, at a temperature of 176 degrees Fahrenheit, or over, until a blue color appears, when the Storch test is applied; second, at a temperature of 160 degrees Fahrenheit for one minute; third, at a temperature of 140 degrees Fahrenheit for twenty minutes.

"Third—The pasteurizer must be provided with a recording thermometer and a temperature controlling device.

"Fourth—The starter used must be kept free from mold and dirt.

"Fifth—All utensils must be sterilized in a given manner.

"Sixth—Light and cleanliness of the creamery building and surroundings, water supply, etc., must be approved.

"Seventh—Butter fat and moisture standards are given for the butter.

"Eighth—Chemical and bacteriolo cal examinations of butter are to t made.

"Ninth—Weekly inspection of the creamery will be made, the expense of same being borne by the creamery.

"Tenth—Certificates of certification must be put on the butter."

NATIONAL CREAMERY BUTTERMAKERS.

The Executive Committee of the National Creamery Buttermakers Association held a meeting at the office of the secretary recently for the purpose of deciding on the location and date of holding their next annual convention. The committee voted unanimously to accept the proposition of the National Dairy Show Association, and the convention will be held Chicago, November 1, 2 and 3.

ARE INDIVIDUAL PUMPING PLANTS AN ADVANTAGE?

By H. U. Roeding, Foxcroft Bldg., San Francisco.

There still remains in many sections of the two main valleys of California, land not under intensive cultivation, on account of the absence of gravity water supply system, whose value and productiveness could be very materially enhanced, provided water could be obtained in adequate quantities to insure the growing of successful crops. The U. S. Geological Survey has spent considerable money and has prepared maps of some of these sections, showing from existing wells used for domestic purposes that the ground waters are located at depths, which in most instances can be tapped and pumped by machinery of standard construction. The cost of such apparatus is well within the means of the landowners, and when properly selected and installed, it increases the cost per acre of such lands only a small amount.

This increased price, however, is small compared to the additional value of the land when under irrigation and equipped with proper pumping machinery to allow watering of the various crops that may be grown.

Even in localities where gravity systems have already been installed, many of the farmers are aware of the difficulty of obtaining the water required, either due to an inadequate supply or the diverting of the flow by their neighbors located on the ditch above them. Coupled with these uncertainties, are the maintenance of these waterways, the annual tax for water and up-keep, as well as the loss of a considerable proportion of area on small farms required for main ditch lines themselves.

All of this goes to prove the value, especially to the smaller farmers, of independent and properly installed pumping equipments. On such land where an ample supply of underground water can be found, there is no question but that in every instance, it is greatly to the owner's advantage to install his own pumping machinery, rather than to depend upon the uncertainty of the annual rainfall or his local water company for supply. With a properly laid out and installed pumping plant, each individual farmer is absolutely independent and can irrigate as often and whenever his crop may demand water.

The art of manufacturing machinery suitable for these isolated plants for whatever capacity, has advanced to such a state that the cost of installation and operation is low and when correctly selected and installed to best meet the requirements of each individual case should not be the cause of any trouble or annoyance whatever.

There are many such plants operating at present, some of which are giving the best of service; others, however, have been discarded and condemned, due to errors in installing machinery not suited to meet the local conditions. Unless such pumping equipments are properly engineered, they are apt to cost their owners greatly in excess of their actual value, not only for the machinery, but for operation as well, and be the cause of constant trouble and annoyance.

Sawdust washed into Clover Valley Creek during storms of last winter has caused the death of great quantities of trout.

Sugar-Beet-Pulp takes the place of green grass and is the best butter producer in the world. 50 cents per ton at Los Alamitos Sugar Factory.

MEADOWS AND PASTURES.

A book with the above title may not appeal to Californians, for it is written in surroundings of which the preface speaks as follows: "I sit to write this book just as spring comes timidly sweeping over the land. Winter has been long and cold, the naked cornfields are sodden, gullied with winter rains; there is no hint of life thereon. Wherever the plow held sway last summer there is rueful countenance today. I look out across wide stretches of meadow and pasture land. There already the ground is covered with greenness, the tiny grass blades are pushing up, the clovers are coming, too, the soil is alive, the field is a living thing, robing itself with green. On the corn lands there has been waste during winter. The rains have washed, the fertility has leached away. Not so with the fields of grass and clover; they have more than held their own; they are richer, not poorer, for the lapse of time."

It is true that California has but few meadows, as they are called in the East, though we do not see why the word, meadow, does not apply to an alfalfa field as well as to timothy, but sure it is the word is not common in this state. Notwithstanding that, the general fund of information contained in the book about grasses makes it invaluable for any library. Our own money maker, alfalfa, is given extensive treatment; even its irrigation is touched upon. Many others of the legumes are also fully described, and the best methods of securing the greatest returns from them are given.

The book is written by Joseph E. Wing, the author of "Alfalfa in America," one of the standards on alfalfa; published by the Breeders Gazette, 542 Dearborn street, Chicago. The price is $1.50 postpaid.

New Gas Producing Plant

Develops Cheaper **POWER** For Any Purpose

Reduces Fuel Cost From $610.44 to $197.22 in Twenty-Eight Day Continuous Run on 100 H.P. Plant

Cheaper than Electricity, Steam or Distillate.
A Simple, Compact Apparatus that is reliable and continuous in operation and uses any gravity of crude or fuel oil.

Plants already installed and in successful commercial operation. Economy guaranteed and investigation solicited. Process and apparatus sold under exclusive Grine-Nelles patents.

Deciduous Fruit Culture

LOCAL HISTORY OF THOMPSON SEEDLESS GRAPE.

J. W. Mills, Marysville.

There has been a good deal of discussion in the local newspapers recently concerning the origin of the Thompson Seedless Grape. The discussion began with an article by a county horticultural commissioner, when he claimed that this grape was originated by Mr. J. P. Onstott of Sutter County, the claim being made that it was one of three chance fence corner creations that made their bow to the horticultural world on Mr. Oustott's farm.

All viticulturists who have made a study of the history of varieties know that the Thompson Seedless is none other than the Sultanina, whose origin is so far back in the dim past that history has failed to discover it. It originated some place in the old world, and that is all we know about it. It was first introduced into the United States by some Eastern nurseryman, and from there to California.

Below we give a few excerpts from data collected by Mr. W. R. Nutting and kindly forwarded me by Hon. H. P. Stabler of Sutter County. This gives the local history of this valuable grape, and gives credit to whom it is due. This is taken from personal interviews between Mr. Nutting and the pioneer growers of the Thompson Seedless Grape in Sutter County.

"February, 1892. R. C. Kells, County Horticultural Commissioner: I was about the first man who had the Thompson Seedless Grape here. The cuttings were given to Dr. Chandler by Mr. Thompson, who got them from the East. Mr. Thompson was at our place, wanting to get some Zante Currant cuttings, and gave the doctor those cuttings of the Thompson Seedless, and he gave them to Mr. Onstott."

(Mr. Kells was at this time in the employ of Dr. Chandler, and afterward became owner of the Chandler vineyards.)

"B. G. Stabler:

The reason I have planted this grape is that the cooking raisin business has not been overdone. Mr. Thompson got this grape in 1872 and had it in bearing in 1874. He got it from Elwanger & Barry. I got my cuttings from Mr. Starr. Mr. Onstott offered to give me all he had growing of these vines, as he found they were not good bearers, he having pruned them too short. It was a little peculiar how it was first discovered by Mr. Thompson that the vines should be pruned long. Mr. Thompson had one vine that ran on a bee hive and he let it stay there and did not prune it, and found that this vine bore much better than the others. The raisin was grown in this section for sixteen years before it was discovered how to prune it. Dr. Chandler had Sultanas growing four miles below Yuba City, and Mr. Thompson told the doctor about this grape and offered him some cuttings. One day Mr. Thompson brought the cuttings to him and the doctor gave them to Mr. Onstott, saying that he had seedless raisins. This is how Mr. Onstott came by them and how he claimed to be the original originator."

J. P. Onstott gave the address of Atmore & Son, Philadelphia, to whom he had shipped raisins, but refused to be interviewed to any extent.

"Wm. Thompson, Sutter City, Cal.

The first cutting (of Thompson Seedless) I ever grew were planted over in Dist. No. 70, and in 1874 the levee broke and washed them all out."

The above excerpts are from a copy of a stenographic report written by Mr. D. D. Green of Yuba City and transmitted to W. R. Nutting in San Francisco, on March 23, 1892.

In the early 80's the Sutter County Horticultural Society was organized through the efforts of Mr. B. G. Stabler, and it was at a meeting of this society that the grape was given the name of Thompson Seedless, in honor of Mr. Thompson who introduced it into this state and first discovered its merits. I was present at that meeting and took part in the proceedings and I think Mr. J. P. Onstott was also present. The proper name of the grape is Sultanina, with the two synonyms, Lady de Coverly and Thompson Seedless. It is entirely distinct from Sultana and is much superior to it. The great bulk of seedless raisins imported from Southern Europe every year under the name of "Sultanas," is none other than Sultanina or Thompson Seedless.

AMERICAN BREEDERS MAGAZINE.

Volume II of the American Breeders Magazine, published in Washington, D. C., begins with a number which is up to the usual high standard of that periodical. This publication is unique, in that all the articles printed therein have been specially prepared by members of the American Breeders Association. The subject matter covers a wide scope and illustrates in a remarkable way the varied activities of that organization. The subject of breeding and heredity is at present receiving considerable popular attention, and the presentation of its various phases in attractive and popular style, free from scientific mannerisms and technical expressions and in plain, everyday English, will greatly tend to still further stimulate public attention.

The fascinating subject of race improvement or Eugenics is recoginzed by two immensely important articles. In one, on "Heredity of Lefthandedness," by Dr. J. W. Jordan of the University of Virginia, the fact that lefthandedness is hereditary is made fairly clear. In a second, in form of a committee report, Dr. C. A. Rogers, Faribault, Minnesota, chairman of the Committee on Heredity of Feeblemindedness, writes on that subject. This will specially interest those who have had the privilege of reading Dr. Goddard's excellent article on "Heredity of Feeblemindedness" in an earlier number of the magazine.

Prof. M. W. Harper, Cornell University, N. Y., under the title of "Improvement in the Selection of Breeding Cattle Through Advanced Registry Records," throws new light on the value of performance records. In fact, this article is considered one of the most valuable contributions to breeding of dairy cattle in recent years. It is based on a study of the breeding of several thousand animals recorded in the Advanced Register. Figures are submitted which go to show that the certainty of transmission of the ability to perform increases with the number of advanced registry ancestors in an animal's pedigree. Some very instructive statistics treat of the ques-

tion of the relative male and female potency to transmit ability to perform.

The fact that this conutry imports annually $14,000,000 worth of Persian lamb furs lends peculiar interest to an article by Dr. Young of Texas on "Karakule Sheep." He shows how, by crossing Karakule blood on high grade long wool sheep, a brilliant and lustrous "Persian skin" can be produced in this country, and that the profits of this industry can be pocketed by breeders in this country.

The technical phase of breeding is touched upon in a paper by Prof. B. F. Roberts, Kansas Agricultural College, describing "A New Method of Open Pollination." And closely related to this subject is a paper by Prof. S. N. Green of the Experiment Station at Wooster, Ohio, on "A New Method of Handling Pollen."

Dr. Byron D. Halstead of the New Jersey Experiment Station mentions for the benefit of hybridizers and Mendelians a helpful device showing "The Use of Geometrical Figures in Plant Breeding."

Then there are editorial discussions on the relation of the larger breeding propositions to economics and to social welfare. Under the caption of "Notes and News" is mentioned a variety of corn specially bred to thrive and mature at an elevation of 6,000 feet; the use of certain symbols in the construction of eugenics pedigree charts; the importance of raising the second generation of a hybrid in order to get the benefit of new and useful combinations.

The magazine is abundantly illustrated, the details of figuring of the Persian lamb furs being shown by a number of excellent photographs.

USE OF FERTILIZERS.

Soil foods seem to be rapidly gaining in popularity or absolute requirement, or perhaps both, among the agriculturists of the United States. The total value of imported fertilizers, including materials largely though not exclusively used for that purpose, aggregated $40,000,000 in the calendar year 1910, against $10,500,000 in 1900, and $5,500,000 in 1890, according to figures compiled by the Bureau of Statistics of the Department of Commerce and Labor; while other reports covering the production of fertilizers indicate also a large and perhaps equally rapid growth in domestic output of the various materials used for fertilizing purposes. The production of phosphate rock, for example, largely used in the manufacture of artificial fertilizers, increased, according to reports of the Geological Survey, from $6,500,000 in 1904 to $10,750,000 in 1909; while the Census Office reports the value of fertilizers manufactured in 1890 at $39,000,000, in 1900 at $45,000,000, and in 1905 at $57,000,000, and if the rate of increase just shown with regard to the production of phosphates, a basic material in the manufacture of fertilizers, occurred also in the output of manufactured fertilizers during the period since 1905, the total production in 1910 was probably $70,000,000. Meantime the United States exported last year fertilizers to the value of $10,000,000, making the approximate consumption of soil foods by the farmers of the country about $100,000,000 per annum, omitting consideration in this connection of cotton seed meal, used in part as fertilizer material, but largely as a food for live stock.

The increase in importation of the more important class of articles used as fertilizers is indicated by the following figures: Imports of soda nitrate, or Chile saltpetre, have increased from $3,000,000 in 1890 to $5,000,000 in 1900, and to over $16,500,000 in the calendar year 1910. The imports of potash salts of the fertilizer class, chiefly the muriate and sulphate, have increased from $1,000,000 in 1890 to $2,000,000 in 1900, and six and two-thirds millions in 1910; while imports of phosphates, guano, kainit and other fertilizers have increased from over $1,000,000 in 1890 to $2,000,000 in 1900, and $9,500,000 in 1910.

The commercial sources of the elements chiefly relied upon as soil foods —nitrogen, phosphoric acid and potash —are comparatively few. Nitrate of soda, valuable because of its high content of nitrogen, comes almost exclusively from Chile, from which the imports amount to over 300,000 tons, valued at about $13,000,000, per annum. The potash salts are practically all the product of Germany, the imports therefrom of muriate of potash, valuable by reason of its richness in available potash, ranging from 200,000,000 to 400,000,000 pounds, valued at from $3,000,000 to $5,000,000, per annum. The imported sulphate of potash also comes chiefly from Germany, though smaller amounts are imported from Belgium, Austria-Hungary and Japan. Imported guano comes from a considerable number of countries, though mostly from Peru and Germany, smaller amounts being imported from the United Kingdom, Mexico, Netherlands, the Dutch West Indies, and, in some years, from Uruguay, Venezuela, and British possessions in Oceania. Of the imported crude phosphates Belgium, French Guiana and British Oceania are the chief sources; while of the other imported fertilizers not separately enumerated by the Bureau of Statistics Germany is the chief source, supplying from 70 to 80 per cent, the remainder being chiefly from the United Kingdom, Canada and Belgium.

Additional evidence of the increased consumption of artificial fertilizers in the United States is contained in the figures of the census, which show that the number of establishments devoted to that purpose has increased from 278 in 1880 to 553 in 1905; the tons of material used, from 727,453 to 3,591,771; and the value of their product from $20,000,000 in 1880 to $57,000,000 in 1905. The materials used by the domestic fertilizer industry in 1905 included bones, tankage, etc., $5,000,000; phosphate rock, $4,500,000; potash salts, $3,500,000; superphosphates, $3,000,000; cotton seed meal, two and one-third millions; pyrites, $2,000,000; kainit, nearly $2,000,000; nitrate of soda, $1,750,000; sulphuric acid, $1,000,000; fish, nearly $1,000,000; amomnia sulphate, a little over a half million; and various other articles, such as sulphur, lime, wood ashes and salt.

A writer in the Kansas Farmer says: "Last fall I smeared some trees with axle grease to keep the rabbits from peeling them, and this spring I found I had killed all the small trees. The bark was dead and black just as far as the grease went, although the tops started to grow."

During 1910 the United States exported 50,289 barrels and 72,311 boxes of apples to Hamburg, Germany. American apples are much appreciated in Germany and are bought by all classes of people.

The importance of a large humus supply to any soil cannot be overestimated, since it is upon this more than any other one factor that the productiveness of soil depends.

The La Verne Rotary Cultivator

The principle of Rotary Cultivation is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool works so close to the ground, with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil tends to keep them sharp and one set usually lasts a season. We guarantee satisfaction in regard to work and quality of construction.

HOUSEHOLD DEPARTMENT.—Give; Honor Regained; Peroxide of Hydrogen; Cucumber Pickles; 186, 187.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 188, 189.

SEPTEMBER RURAL.

Across the top of the cover of the September Rural Californian is "This Issue Sebastopol Apple Show," and underneath the usual title head is an illustration of Sebastopol's apple, the Gravenstein. As indicated by the quoted line, the Sebastopol Gravenstein Apple Show will be given particular attention. That show is on this week and people from many parts of the state are attending to gather information as to Sonoma County's apple growing possibilities. The Cultivator gave an extended review of last year's show, and in addition to the account given by the September number of the Rural Californian, the Cultivator will have something to say of this great section in a later number.

While we are referring to the Rural Californian, may we be permitted to call attention to this valuable magazine. The June number was largely given to cotton as grown in Imperial Valley and furnished a fund of information on the cotton industry which has been much appreciated. The July number had to do with sugar beets and the matter appearing in it has been considered of enough importance to be quoted in papers all over the state. The August issue was general in scope and contained matter of much interest. For the September issue the apple will be given the center of the stage, and some following issue will probably be given to Lima and other beans produced in this state.

The Rural Californian is a comer. It has been the effort of the publishers to put out not only a fully illustrated and handsome magazine of California rural life, but to give with this attractiveness a fund of useful information which will make it a power for good.

EUROPEAN LEMONS.

The first article in this week's Cultivator is most intensely interesting reading. It touches upon some of the points developed in a recent trip of Mr. G. Harold Powell, Secretary and Manager of the Citrus Protective League of California, which has to do with the more general matters which may make or break the citrus industry of this state. Realizing the fight which would be on, in fact, already commenced, in Congress for free citrus fruits or reduction of the tariff on citrus fruits, Mr. Powell has spent several months in citrus producing sections of Europe, collecting many facts which will be invaluable in the fight which will doubtless be sprung in Congress when it convenes on the first Monday in December.

The importers have provided an immense fund for use in the future, as it has already been used liberally, to secure more favorable consideration of the lemons of Sicily. The California grower must be awake to these facts, and to that end should read the article in this week's Cultivator.

SOIL INVESTIGATIONS.

A most interesting trip was begun from Los Angeles on last Saturday by a number of gentlemen of this state and two representatives of the Department of Agriculture of Washington, D. C., James Mills and P. T. Evans of Riverside, W. S. Guilford, Director of Agricultural Investigations on the holdings of the Sacramento Valley Irrigation Company at Willows, Glenn County; A. H. Grubb, Consulting Agriculturist for the same company at Carbondale, Colorado; L. J. Briggs, Soil Physicist from the Bureau of Soils, and H. L. Shantz, Soil Physiologist and Pathologist of the Bureau of Plant Industry, Mr. Mills and Mr. Evans, Jr., and two machine men. A few points in San Diego and Orange Counties were visited and on the return the whole citrus producing section of the southern part of the state. Later the trip will carry the party through Ventura and Santa Barbara Counties, crossing over the hills to Bakersfield and doing the San Joaquin Valley, both east and west sides. The Santa Clara Valley will also be touched and the Sacramento Valley, especially Willows, Oroville, Chico, Live Oak and on up to Tehama.

Messrs. Briggs and Shantz are securing general information as to effect of soils on condition of plants. Their work is preliminary and it is hoped will lead to the appointment of specialists who will come and make soil questions a special study.

NATIONAL AID TO EDUCATION.

We have a letter from Senator Carroll S. Page, also a draft of Senate Bill Number 3 introduced into the United States Senate in April by Mr. Page. The bill calls for an appropriation equalling one cent per month per capita to be used by the national government to aid in the education of the young of the country. Mr. Page says:

"We spend ten or twelve million dollars to build and equip a single battleship. The same sum spent for the boys who are to be our farmers and industrial workers, and for those girls who are to be our homemakers, would change the whole course of their lives and thereby materially benefit the nation.

"I believe that the expenditure of one cent per capita per month by the national government—and that is what my bill calls for—if expended under wise direction of a properly organized force, would put in motion the entire machinery which is outlined by my bill and which I feel confident will bring about the results so absolutely essential to the welfare of the great mass of the boys—and girls, too—of our land."

ANOTHER CONTEST.

Readers of the Cultivator may remember an account of an interesting contest of farmers in Glenn County in which a valuable Holstein cow and heifer were given as prizes for well kept and improved ranches on the lands placed under irrigation by the Sacramento Valley Irrigation Company. This contest was held in October and since that time the same and many other farmers have been preparing for another contest to be held the coming October. The company was so pleased with the results last year that the list of prizes will be materially extended. Just what they will consist of is not yet announced, but pure bred cows, hogs and chickens will all be offered. Mr. W. S. Guilford, in charge of agricultural experiment and instruction work for the irrigation company, informs us that the competition will be far keener this year than last, when its scope was not understood by the farmers, but the worth of the prizes offered and the spirit of emulation which it has instilled are working up a great interest. The date of decision is not yet announced, but it will be about the middle of October.

FARMERS INSTITUTES.

Farmers Institutes under the direction of J. B. Neff will be held in Lompoc, Santa Barbara County, September 1-2; Templeton, San Luis Obispo County, September 4; Nipomo, September 5; Guadalupe, Santa Barbara County, September 6; Santa Maria, September 7; Los Alamos, September 8; Santa Ynez, September 9.

CONSERVATION CONGRESS.

The Third National Conservation Congress will be held in Kansas City, Mo., September 25, 26 and 27. The general objects of the conservation congress, as set forth in its constitution, are to provide discussion of the resources of the United States as a foundation for the prosperity of the people, to furnish definite information concerning the resources and their development, use and preservation; to afford an agency through which the people of the country may frame policies and principles affecting the conservation and utilization of their resources to be put into effect by their representatives in state and federal governments. As the strength and prosperity of the American nation depend largely on the natural resources and the population of the interior, special attention will be given at this year's conference to the soil and to the maintenance and improvement of that fertility which brought settlement and wealth to the interior states.

In recent years the world's wheat crop has averaged slightly more than 3 billion bushels annually, of which about 8 per cent is exported from one country to another in the form of flour and 17 per cent in the form of wheat, making a total of about 25 per cent of the world's wheat crop which enters international trade. The United States exports about 52 per cent of all the flour that is shipped from one country to another, and about 11 per cent of the wheat. Including flour with wheat, the United States furnishes about 18 per cent of the total international trade in wheat, including wheat flour.

The mind trained to observe the little things in nature and keen to watch results of certain experiments, makes for success in farming as well as in any other calling. Too many farmers depend upon the rule of thumb or on getting information from others as to methods of procedure. With constantly depleting soils, with competition keener than ever, with greater skill required in marketing our products, all combined, there is a demand for more intensive culture. More intensive culture means more work, but the keen mind develops methods of accomplishing more with less work so far as possible.

Notwithstanding the continued drouth of late June and early July over nearly all parts of the East, the Crop Reporting Board states that the condition of cotton on July 25th was 89.1 of normal as compared with 88.2 on June 25th this year and 75 per cent on July 25th of last year. This is a good showing and apparently King Cotton will come through with flying colors this year. We may be pardoned for a bit of pride in calling attention to California's figures which show a condition of 99 per cent of normal. This is a decline of one per cent during the month of June 25th to July 25th.

The poultrymen of the state are vying with each other in telling big stories. The Cultivator reprinted one of these last week telling of an egg laid by a White Leghorn, seven inches in "diameter." Of course that was going some, but now comes a poultryman at Riverside who set two Rhode Island Red hens on 13 eggs each, which resulted in a hatch of 25½ chicks. If our poultry people keep on somebody may be induced to stretch the truth, although, of course, this has not been done yet.

Agricultural News Notes of the Pacific Coast

Northern California

Meridian, Sutter County, has hopes of a sugar factory.

This is the week of the Gravenstein Apple Show at Sebastopol.

One hop grower near Healdsburg is advertising for 600 hop pickers.

Butte County's olive crop will surpass that of any previous season.

Corning, Tehama County, will organize a poultry growers association.

Palermo, Butte County, is harvesting a large crop of Muir and Elberta peaches.

The Cannery at Santa Rosa has 350 people busy with the biggest run of any season.

Muscat vines at Oroville are carrying a fairly heavy crop of exceptionally fine fruit.

Upper Matole, Humboldt County, expects the early establishment of a new fruit cannery.

The Pomona Grange of Sonoma County is discussing the advisability of smaller grain sacks.

Davis and Woodland, Yolo County, are making a strong fight for a State highway through the Yolo basin.

Sacramento Valley hop growers expect to make fortunes from this year's crop, the prices being the best ever.

Waters of the Matole River in Humboldt County will be used for irrigation of sections heretofore unirrigated.

A big electric pumping plant has just been installed at Meridian, Sutter County, and will irrigate a large tract of alfalfa.

Rice growers at Biggs, Butte County, are compelled to employ duck herders to keep wild ducks out of the rice fields.

A new creamery at Gridley, Butte County, is now running on a full supply of cream and a fine product is being turned out.

A rancher at Tres Vias, Butte County, is pumping a thousand inches from the Feather River for irrigating a large tract of land.

The heaviest shipper in the deciduous line at this time, as shown by Sacramento reports, is the pear, with the peach a close second.

A contract has been awarded for construction of canal to carry the waters of Lost River so that a large tract of land will be reclaimed.

Officials of the Reclamation Service will visit the Orland project and it is now hoped that the Secretary of the Interior will visit the same project during September.

Residents of Lakeport, Lake County, are making an aggressive fight on undrained tule lands which are affording breeding grounds for numberless gnats and mosquitoes.

With the handling of great quantities of sugar beets and of fruit Yolo County's labor is proving too short for the situation. Japs and Hindoos are being called upon in the emergency.

The hop picking season at Wheatland, Yuba County, is now on in full swing and hop pickers' tents make the vicinity of many of the yards a busy looking scene. Some yards are so large that 1600 to 1700 pickers are employed at a time.

Central California

Malaga grapes have been commanding $1.50 to $2.10 per box in Philadelphia.

Delano, Kern County, will have a wheat crop of a hundred thousand sacks.

Drawbridges will be placed in the San Joaquin to permit of winter navigation.

The Spreckels Sugar Factory will begin its campaign on Friday, September 1st.

Prune growers are greatly elated over 5½ and 5¾ cent offers, four-size bag basis.

Fresno County shipments of Elberta peaches have been far heavier than anticipated.

Grain and fruit growers of Monterey County are appealing for more rigid enforcement of the squirrel ordinance.

The success of a few walnut orchards about Stockton, San Joaquin County, will induce large planting next season.

Thompson seedless raisins are reported to be exceptionally strong at Fresno at 6¼ cents.

One feature of the Fresno County Fair will be a $215.00 special prize for a five-day milking contest.

One shipper has sent from Hanford and Guernsey, Kings County, 16 cars of hogs to San Francisco.

The Fresno County Fair management announces purses to the extent of seventeen thousand dollars.

The Kings County Raisin and Fruit Company predicts a general price of five cents for Muscats in the sweat box.

A dam is to be placed across the Big Creek in Eastern Fresno County in order to impound water for power purposes.

Coalinga, Fresno County, is making an effort to secure Government aid in the building of a dam for reclamation purposes.

At the last meeting of the San Jose Grange the principal discussion hinged upon good roads and the use of water in preserving them.

P. F. Adelsbach of Kingsburg is working on a plan of organizing grape growers along lines similar to the California Fruit Growers Exchange.

Secretary Brooks of the San Jose Chamber of Commerce made an address before the poultry producers at the Nevada State Poultry Show last week.

Hughson, Stanislaus County, is making a fierce fight on the ground squirrel pest. There are eleven inspectors now observing the work in Stanislaus County.

Merced County Horticultural Commissioner is making a special campaign on Johnson grass, and is serving notice for immediate cutting before the pest goes to seed.

Fresh fruit shippers at Fresno are reported to be squirming from under contracts made earlier in the season because bad conditions in the east have lowered market prices.

Over 150 people were present at the last meeting of the Kings County Dairy Association. Constitution and by-laws were adopted and the association is now ready for active work.

Southern California

Some growers of apricots near Ventura report much heavier crops than last year.

Fierce forest fires were started in the San Jacinto Mountains near Banning last week.

The El Cajon Valley in San Diego County, observed last Saturday as a special fruit day.

The Tustin Hills Citrus Association is shipping oranges again after a rest to install a new grader.

Santa Barbara and San Luis Obispo Counties both report excellent showing on English walnuts.

Grape growers in Imperial Valley have just finished the most successful season yet experienced.

Orange County growers are being offered 14 cents for dried apricots, but some are still holding for the 15 cent limit.

Orange County estimates an output of about 200 tons of honey. Prices have been ranging from six to seven cents.

A gift of ten acres of valuable citrus land has been made by Riverside people to the University of California for citrus experiment station work.

The apricot growers of Orange County are elated over the $31.00 per ton which they have received for apricot kernels.

Reforestation on a large scale will be given a fair test in the great areas burned over in the mountains of San Bernardino County.

Northern Santa Barbara County people are anxious over the possible ravages of the Sisquoc River and efforts are being made to secure control.

Beaumont, Riverside County, now has a thriving Poultry Association organized to aid in the marketing of the products and the purchasing of supplies.

The vote on bonds for a protection district which will care for the storm waters at Arroyo Grande, San Luis Obispo County, carried by a large majority.

The Southern California Sugar Company's factory at Santa Ana made a record run last week when it produced in one day 1860 hundred-pound sacks of sugar.

The Mutual Orange Company of Redlands reports an average of $1.59 per hundred pounds on fruit shipped during the year. The later pools proved more satisfactory.

Walnut men generally are hoping for a 15 cent price on their crop this year but its large size is causing some to waver. Those in close touch with the situation, however, maintain that the association price will be 15 cents.

Apricot growers at Hemet, Riverside County, are elated over a return which it is said will average over $200 per acre return from their trees for the past five years. Some Hemet growers have realized between $300 and $400 per acre this year.

The Chino sugar factory is running about 800 tons of beets or 2500 sacks of sugar daily. The pulp drying department of the sugar factory of Chino, San Bernardino County, reports its new plant as working in the best condition and turning out a fine product.

The Coast

Toppenish, Washington, is shipping 35 cars of hay daily.

"Ideal harvesting weather" is reported from most sections of Oregon.

The State Grange of Oregon has drawn up a new highway bill and will urge that it be passed at the coming legislature.

One farmer at Weston, Oregon, has an average yield of 60 bushels of wheat to the acre.

An American Company with $25,000 capital is planting a tract of land near Zamboanga to rubber trees.

A hop grower at North Yakima, Washington, will clean up $12,000 on his 38-acre hop yard this season.

Fifty land owners at Glenwood have petitioned the Commissioners of Klickitat County for an irrigation district.

The Inland Empire of Eastern Washington is harvesting a far better crop of wheat than anticipated earlier.

The Deschutes Land Company will reclaim 31,000 acres of land situated in Crook and Klamath Counties, Oregon.

The Agricultural College at Pullman, Washington, has just received some exceptionally fine pure bred Tamworth hogs.

Shade trees at Baker, Oregon, are to be destroyed in order that wooly aphis and other pests may be wiped out of existence if possible.

Tests of wheat made at the University of Idaho at Moscow proved that wheat planted after peas or potatoes has been improved in quality.

A reserve of nearly 40,000 acres has been created by the Governor of the Hawaiian Islands. It is of forest lands on the Island of Hawaii.

A new high line ditch will be run by the Hanford Irrigation & Power Co. to reach a large tract of new land near White Bluffs, Washington.

Fruit growers of Spokane County, Washington, have organized a co-operative marketing organization. The first President is Daniel Klein.

Pear and apple growers of Walla Walla, Wash., are making a strenuous fight on the fire blight which is threatening the life of their business.

Notwithstanding the Northwest produces great numbers of swine, the Union Stock Yards at Portland is compelled to bring in hogs from the Middle West.

Alfalfa growers near North Yakima, Washington, and whose lands are on the Indian Reservation are receiving more than three times as much water as they did last year.

Scientists are investigating the manganese soils of Wahiawa district, Hawaiian Islands, and are endeavoring to discover methods of making more productive to pineapples.

Klickikat County, Washington, is rapidly filling its warehouses with grain which has been averaging this year about 20 bushels per acre. Some of the newer introduced hybrid wheats have proven satisfactory.

The last issue of the Hawaiian Forrester and Agriculturist reports, "Since last issue the public has been apprised that the Mediterranean fruit-fly has gained a shockingly long march upon the susceptible fruits of the Island of Oahu.

Animal Matter a Necessity For Poultry

Experiments at various State Experiment Stations have demonstrated beyond a doubt that Protein derived from an animal source is far superior, as an egg producer and flesh builder, to Protein derived from a vegetable source.

Our High Protein "Special" Beef Scraps Will Supply That Necessity

If your dealer cannot supply you, write us, and we will send you samples and price.

Made in California from fresh Packing House Products. Look for the word "Special" in red ink on every sack.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

DEVELOPING THE EGG-LAYING QUALITIES OF THE TURKEY.

W. N. Irwin of the United States department of agriculture, says the only reason this feature of the poultry industry has not been developed is that farmers have paid no attention to it. "I have been eating turkey eggs and turkeys for many years," says Mr. Irwin, "and have found them better than any other article of food. The thing that started me looking into the possibilities of the turkey was this liking for the eggs. For several years I have been haunting the central market of Washington three times a week and buying up turkey eggs. Most of the farmers who bring them to town to sell for food save the eggs for me. I have bought as many as 145 dozen in a year. In the spring, of course, I cannot get the eggs, since they are too valuable to sell for food. So I have found that the eggs can be kept very easily all winter. For example, I have some eggs now that I shall not eat until next March. But experience has shown me that turkey eggs kept for that length of time by ordinary means, will poach nicely. An egg that poaches is a good egg. I do not put the eggs in cold storage, but keep them cool and dry.

"I believe turkey eggs are as much superior to ordinary hen's eggs as is turkey meat to that of chickens. It took 200 years to get White Leghorns to lay 200 eggs a year and not many of them come up to that standard even now. I do not believe it will take anywhere near that long to develop 200-egg turkeys for there have been many changes and advances since experiments were begun with Leghorns. Besides I have found at least one man near Washington who had a 200-egg turkey and dozens who say they have birds that lay upward of 100 eggs. Even a 100-egg bird would be a distinct advance.

"The time has passed when the farmer can afford to raise turkeys for one setting of eggs. The man who told me he had a 200-egg turkey hen killed his bird for the market. I told him he killed at least $100, and he, of course, did not realize it at the time. One gentleman told me the other day that he has two turkey hens that have laid upward of 100 eggs this year and are still at it. He cannot get them to stop long enough to fatten them for Thanksgiving. I told him not to think of fattening them, for they are worth vastly more to him for breeding purposes.

"At the least calculation, a 200-egg bird should bring $25. If a farmer raised 100 such birds in a year, his gross income from them would be $2500. Such a breed of turkeys can be developed only by patient, careful selection from year to year.

"This industry must be undertaken with reasonable conservatism. I believe the results are certain, but persons who go into the work must expect to wait patiently for the promised results. If a farmer had from 50 to 100 birds that laid upward of 100 eggs a year, he would have no trouble in getting big prices for them. It would not be necessary to wait until the birds get up to the 200-egg class to make big money out of them for their laying qualities.

"The Rhode Island Experiment Station has become interested in the work. First, they started with eggs from birds that laid upward of 100, but for some reason the experiment failed. Now they are working with some young birds. I would advise any farmer who thinks of going into the work to start with young birds from late broods."

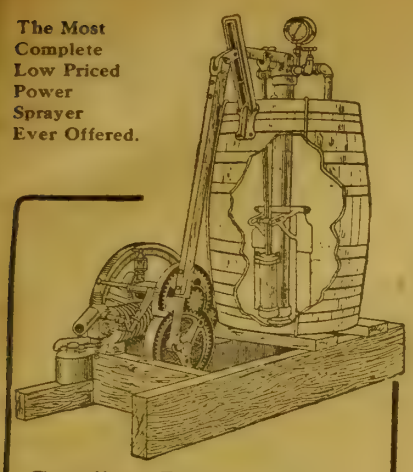
TO HASTEN MOLTING.

Every poultry raiser knows the value of having the hens out of the molting period before the winter season sets in, if there are to be any eggs for market while prices are high. And those who intend exhibiting their fowls at the fall fairs know that unless the fowls are through their molt and have their new feathers, it will be useless to show them and expect to win any prizes. Therefore a few lines on how to hasten molting will be of service to the farmer who wants eggs in winter and to the fancier who wants to exhibit his fowls.

Recently there was conducted at the West Virginia Experiment Station a series of tests for a method of hastening the molting period. This method consisted principally in withholding food, either wholly or in part, for a few days, which stops egg production and reduces the weight of the fowls, and then feeding heavily on a ration suitable for the formation of feathers and the general building up of the system. The experiments began August 5 with two pens of Rhode Island Reds and two pens of White Leghorns, about two years old. One pen each of Rhode Island Reds and White Leghorns received no food for 13 days, except what they could pick up in their runs, which had been sown to oats in the spring. These runs were 15 feet wide and 100 feet long, and nearly all the oats had been picked from the heads before the beginning of the experiment. The other two lots of fowls were fed as usual on mash, beef scraps, corn, wheat and oats. After the expiration of 13 days all four lots of fowls were fed liberally. Each lot of fowls contained 20 hens and two cocks. Thirty days after the test began, the "no-food" pen of Rhode Island Reds had practically a new coat of new feathers, had begun to lay and within a week from that time one-half of the hens were laying regularly, while the other lot of Rhode Island Reds were just beginning to molt and the egg production had dropped down to two or three eggs per day. Both lots of White Leghorns were a trifle slower in molting than the Rhode Island Reds, but otherwise the treatment affected them in the same way. The experiment proved that mature hens, which are fed very sparingly for about two weeks and then receive a rich, nitrogenous ration, molt more rapidly and with more uinformity and enter the cold weather of winter in better condition than similar fowls fed continually during the molting period on an egg-producing ration.—Kansas Farmer.

Few men understand the possibilities of two dozen hens, when worked up to the limit of their capacity.

The Most Complete Low Priced Power Sprayer Ever Offered.



Gasoline Power Sprayer

Complete Ready to Operate

$92.50

Equipment includes Sprayer with Bronze Plunger, Gland, Valves and Strainer, large Air Chamber and Positive Agitator operating with each stroke of the Pump, all mounted in a Barrel, with 200 lb. Pressure Gauge, Water Relief Valve, and Gate Valve on Discharge; Air Cooled Gasoline Engine with Batteries, Spark Coil, Fuel Tank, 25-feet ½ in. High Pressure Hose, 8 feet Iron Pipe Extension with Cock, Brass Y and Two Mistry Nozzles Uses only one pint of gasoline every three hours.

THE SHOW BIRDS.

The birds intended for the show ring must be carefully selected. If one is not sure of himself it will pay to have some one, well up in poultry lore, to assist in this most important matter. After selecting the birds should be carefully studied and handled frequently to make them docile. They must be fed judiciously to get them in the pink of condition. No broken feathers, no lopped and scarred combs, no scaly legs will "go" in the show room, without a severe cut. It is early yet to separate them, unless one has ample room and accommodations, but a little later they should be cooped separately. The cocks and cockerels must be kept separate, now, if there is any tendency to fight. While not wise to coddle them too much, it is yet necessary to feed enough to insure standard weights. Pullets are in the pink of condition just before beginning to lay. Hens should be well moulted and full feathered, also cocks. Cockerels should also be in full feather and the feathers ripe, else, if white fowls, they show creamy tints. They should have a little meat, in some form, to ripen up the feathers. If the legs have any sign of scales, it is not too early to begin treating them. All parti-colored fowls must be cooped in clean coops.—Journal of Agriculture.

RHEUMATISM IN POULTRY.

Damp floors and walls bring on rheumatism. Throw open the chicken house on fine days and let the blessed sunshine in. Pure, dry air is much healthier than warm air highly charged with moisture. Rheumatism is almost never seen in flocks where the quarters are dry. A little common baking soda put in the water where the hens drink will help to prevent a leg weakness. Water fowls—geese and ducks—can not stand dampness in their quarters any better than chickens. A great many people ignore this fact. They imagine because ducks and geese like water they do not need dry sleeping quarters. They do not roost high up as do chickens, but prefer dry, clean straw to squat on at night. Where boards are used as a floor, there is apt to be more or less drafts from cracks unless a quantity of dry dirt or sand is kept on the floors. A scratching shed should always have a floor of earth. Such a floor is absolutely free from drafts. Cover it well with litter and you will then have no rheumatism among your fowls.—Exchange.

TO STOP THE CROW.

It is said to prevent the donkey's bray it is only necessary to tie down his tail. Now comes the daily paper with a dispatch from "Chi" with the following:

"'How to Stop a Rooster From Crowing' is the title of a pamphlet that has been prepared by William Luthardt, secretary to Chief of Police McWeeny of Chicago.

"Since the publication a few days ago of a story that told of the chief's success in supressing the rooster, the head of the police department has received scores of letters asking him to stop crowing roosters in all parts of the city.

"'Say, Billy,' said the chief to his secretary yesterday, 'we will have to answer these letters about the roosters.'

"Secretary Luthardt wrote the following instructions to owners of roosters:

"'This department has received several complaints from persons whose early morning slumber is disturbed by crowing roosters. It is natural for a rooster to crow, but in order to do so he must raise his head. A simple device to stop the bird from crowing is to nail a board twelve inches above the perch in the chicken coop. This will prevent the rooster from raising its head to the proper angle for crowing, thereby suppressing the clarion notes.'"

POULTRY NOTES

A drop of glycerine is a sovereign remedy for sore eyes.

Lawn clippings and green waste from the garden make good chicken feed.

Healthy, strong and vigorous breeding stock is necessary for quick growing, profitable market birds.

See that the old hens do not get away with the feed meant for the chicks. The chicks should be fed in a place for themselves, where the older hens cannot bother them.

A Canadian authority says that in his opinion the most profitable egg laying fowl will be found in the white or buff variety of the American class. As a class, he says, they will beat all comers.

Linseed meal is made by grinding flaxseed from which the oil has been more or less completely extracted. "Old process" contains more fat and somewhat less protein than "new process" linseed meal.

If you stop to look at it, a feather is a masterpiece of creation. The covering of a bird combines in a wonderful manner lightness and complete ventilation, a first-class non-conductor of heat, and repels dirt.

A drop of sweet oil on the head and under the wings of the chicks will generally be sufficient to keep them free from lice, though you can overdo the matter and kill the chicks by using too much grease or oil.

Lice are the bane of the poultryman's life in the summer time, and they must be eradicated from the chicks, the adult fowls and from the poultry house, to secure any degree of success in the business.

The old fowls should be dusted quite frequently during the summer with insect powder, though if you provide them with a suitable dusting place they will try mighty hard to keep themselves free from lice.

Pump Jacks, Pumps, Belting, Etc.

chasing geese in the market, prefer a bird with a yellow or an orange-colored bill. So long as they can procure a light-colored bill they will not purchase the geese with the black bills.

The poultry house should be sprayed with whitewash several times during the summer to keep the house in good condition for the fowls. The roosts and nest boxes should be taken outdoors and given a thorough spraying of kerosene oil in which has been mixed some crude carbolic acid.

Gluten meal and gluten feeds are by-products left in the manufacture of starch and glucose from Indian corn. The waste product from the manufacture of starch or sugar is relatively much richer in oil and protein than corn. Many factories are removing part of the corn oil from the waste, so that some gluten meals carry but little oil.

It is said that the calico printers use more than 40,000,000 dozens of eggs each year, and that the coffee roasters and photographic trades, the cracker and biscuit combines and the chemical trades consume more than twice as many. Large quantities are also used in the leather trades, for tanning, etc. They are also largely used in the preparation of many patent foods, and the liquor trade takes no inconsiderable number. For many of these uses, inferior grades of eggs are used—not because they are better, but because they are cheaper. One biscuit company in New York city buys 4,000,000 eggs every week.

When the hens quit laying for the season it should be obvious to everybody that it is unprofitable to longer keep them. But the general run of poultrymen and farmers fail to recognize this point and keep several dozen unprofitable hens around the place. Chicken feed is very high in price, and it is a waste of money to feed non-producing stock, for you cannot get any more for them two or three months hence than you can now. The best thing to do is to sell all poultry that is not actually wanted as breeders for next year. The growing stock need not be disposed of, for they increase in value with age and weight. If these old hens are thoroughbred stock, they may be sold to other breeders for next season's use at a higher price than could be secured at the butcher's, but if the hens are common stock sell them at once to the dealer at whatever price you can get for them, for every day you keep them after the laying season is over you are losing money by them, and the old saying is true that "a penny saved is a penny earned."

DRESSING SQUABS FOR THE MARKET.

One half dozen or more squabs are hung on the rack at one time. The wings of each are then locked, which is done by drawing the wings closely together in the back, allowing one wing to overlap the other. It holds them firmly, and causes no pain.

The mouth of the squab is held open with the thumb and first finger of the left hand, the head and shoulders being held in the hand. With a knife in the right hand, the blade is inserted through the crown of the head, penetrating the brain.

At once the operator releases his grasp and allows the bird to bleed thoroughly before starting to pluck the feathers.

By the time about half a dozen of the birds have been stabbed, the first killed has bled sufficiently to be ready for picking. The squab is then removed from the rack, and held in the hands while plucking the feathers.

This method is said to be the most rapid, it being found that from 100 to 150 squabs can thus be dressed in a day by a good operator.

Some pigeon men believe in holding the bird while killing, but it has been proven that birds do not bleed so thoroughly as when hanging, owing to the fact that the hand more or less compresses the fine veins, thus retarding the flow of blood.

When a bird is not sufficiently bled, it shows itself in blisters. These blisters are red blotches that form on the backs of the birds, and which develop by the time the carcasses reach the market.—Farm World.

Speaking of chicken pox the department of agriculture says: The disease appears on the comb, face and wattles of the bird in the form of yellowish nodules, varying in size from a pin head to one-fourth of an inch in diameter. These nodules increase in size and turn dark red. The disease should be treated as soon as the first nodules are noticed. It is not always fatal and fowls have been known to recover without any treatment. Insanitary conditions and dampness seem to cause the disease. As it is a contagious disease the affected birds should be removed from the flock immediately. If the nodules are removed with a sharp knife, and the affected parts are treated with carbolated vaseline, the birds should recover in a few days. If the case is very far advanced the sick fowls should be given a few grains each of sulphur and cream of tartar three times a day. Oxide of zinc ointment should be applied to the affected parts once a day.

It costs about six cents to raise a squab to five weeks of age.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Catarrh and Cough.

My mare contracted a cold about three weeks ago. There is some discharge from the nose, labored breathing with nostrils dilated and coughing by spells. She has a good appetite, but does not improve under the treatment I give her.—Subscriber, Orange.

The cause of this trouble cannot be determined from your description. Secure eight ounces of Fowler's Solution from your druggist and give one tablespoonful in the feed morning and evening.—F. G. M.

Lump and Worms.

A movable lump under the jaw of a cow was opened about three months ago, but after discharging a while it broke again. The discharge consists of a thick matter. The lump is supposed to have been caused by beards in the hay. A worm passed from her a few days ago. She has a good appetite, but is poor in flesh and the milk yield is reduced though apparently normal. Can this be worms, and should we use the milk?.—Subscriber, Anderson.

Worms may be the cause of the debilitated condition; however, there is no certainty that other tumors, similar to the one under the jaw, do not exist within the body, impairing nutrition. For worms, give a drench containing one pound of Epsom salts and follow after 24 hours with three ounces of turpentine in a quart of sweet oil. Then give, twice daily in the feed, one tablespoonful of a tonic powder containing fenugreek 6 ounces; gentian, 4 ounces; nux vomica, 2 ounces, and dried sulphate of iron, 3 ounces. Should the cow fail to improve under this treatment it would be advisable to discontinue the use of the milk.—F. G. M.

HEALTHY CHICKENS produce BEST RESULTS

SPECIAL QUOTATIONS FOR SUPPLIES IN QUANTITY.

Lightning Chick Grower and Egg Producer is the strongest Egg Food on the market. One tablespoonful to 12 chicks or six hens, mixed with their regular rations, is sufficient. Acts as a tonic and bowel regulator.
50 lb. sacks $4.00

Keep Them Well by Using STAYCO PREPARATIONS

All of the Poultry and Stock Foods we quote are balanced rations of the best grade, properly blended and compounded to get the results looked for in the shortest time possible. Remember they are sold with our absolute guarantee of satisfaction or money refunded.

STAYCO ROUP CURE

A guaranteed preventive and cure for Roup. If it fails, we refund your money. Roup is indicated by a watery discharge from the eyes and nostrils, and if not checked, the head will begin to swell. Stayco Roup Cure is a positive cure.
50 cent size $0.35
$1.00 size ..... .65

STAYCO CHOLERA CURE

After testing many different cures, we have found the Stayco Cholera Cure most effective. It is the best cholera remedy for turkeys. It prevents and cures roup, diarrhoea, cholera and other poultry diseases.
25 cent size $0.20

STAYCO LIQUID LICE-KILLER

Kills lice on poultry without contact with the fowls. Spray the inside of the chicken house—fumes do the work, and not injurious to poultry.
1 quart $0.25
½ gallon ..... .40
1 gallon ..... .65
5 gallons 2.75

INSECT POWDER

For setting hens, young chicks and the dust bath. Death to all vermin. Not intended to take the place of Stayco Liquid Lice Killer, which is always needed in this climate.
2½ lb. package $0.31
5 lb. package ..... .55

STAYCO SQUIRREL POISON

Composed of poisoned grain for the destruction of squirrels, gophers, rats, mice, etc.
1 lb. package $0.16
5 lb. package ..... .70

STAYCO BEDBUG KILLER

Liquid—Non-Poisonous

As the name implies, it is non-poisonous. It is also very efficient and safe, if used away from fire and open lights.
Per gal.....$1.75 Pint .....$ .35

STAYCO SHEEP DIP

This is in concentrated form, 1 gallon will make 100 gallons of Dip. Mixed 1 in 10 of water for sores, barb wire cuts, etc. Use in pure form for ticks in horses and cattle. Mix 1 in 25 for hog wash to kill lice.
5 gallons $7.50
1 gallon 1.75
1 pint ..... .35

CRUDE CARBOLIC ACID

To be used as disinfectant, deodorizer, insect killer, and general purifier.
½ gallons $0.40
1 gallon ..... .75
5 gallons 3.00

BORDEAUX MIXTURE

Universally used for spraying all trees attacked by scale, aphis and other injurious insects. Put up in concentrated form. Write for quotations, and specify quantity wanted.

Questions and Answers

THE EDITOR AND STAFF

Pruning Melon Vines.

I noticed in recent Cultivator statement that an Imperial melon grower had increased production of cantaloupes per acre by planting much closer together and following a system of pruning. Will this farmer be kind enough to give to us his method in the columns of the Cultivator?—Subscriber, Long Beach.

We hope this request will meet the eye of the Imperial grower and that he will favor us with the information. The item in the Cultivator was secured from an Imperial Valley paper which was immediately destroyed, and we do not know the name. We assume that the method consists in planting much closer together than usual, then by thumb pruning or pinching back preventing extended growing and inducing greater production of fruit near the root.

Cucumber Pickles.

Can any subscriber give me information regarding putting down cucumber pickles for home use that will be brittle. I have been in the habit of using rock salt and grape leaves for covering between pickings, but in spite of all they are soft.—Mrs. C. A. R., Gridley.

The grape leaves are of no value in making brittle or firm pickles, but to aid in preserving the green color which the strong brine dulls. The green color may be secured by scalding the pickles in vinegar in brass kettle, but this is not considered a perfectly safe proposition. Other factors of success are use of perfectly fresh cucumbers, not bruising, and some have added a tablespoonful of powdered alum to a gallon of brine. This is not seriously harmful, but with care we do not believe it is necessary, though it gives crispness and brittleness. For more particulars of the method see household page this week.

Citron.

How is the ordinary candied citron used in fruit cakes, etc., produced and prepared?—Mrs. F. H. V., Earlimart.

Citron is produced in the same way as lemons, pomelos or other citrus fruits, though it is generally considered more susceptible to cold weather. There are several orchards in Southern California but we do not know of any in the San Joaquin Valley. The fruit is very large and of course almost entirely composed of the thick rind which is made into the candied citron. The small amount of pulp is scooped out and thrown away after the fruit has been halved. The citron is then submitted to brine bath for several days or weeks. After this treatment the saltiness is removed by the use of pure water. Then it is placed in a weak syrup, later in stronger ones finally in a very heavy syrup. From this it is taken and placed upon trays where the surplus moisture is evaporated. We may add that lemon and orange peel is often treated in the same way and makes excellent additions to cake, mince pies and other similar dishes.

Tomato Blight.

My tomatoes are dying. The plants are set in soil well enriched with barnyard manure and were all right until blooming period when the leaves dried up. They have abundance of water. There are four other varieties in the same row, however, which are not showing the trouble and are now bearing well.—J. C. N., Highland.

This is doubtless a straight case of summer blight, for which there is no remedy as the trouble is at the root. The abundance of water referred to only makes matters worse. In fact, some maintain that if water is withheld and the vines forced to endure a little drouth, they are less liable to blight. It is a bacterial trouble and once within the tissues of the vine, no spraying or root treatment will reach it. The fall blight which strikes plants soon after the warm rains may be prevented by Bordeaux spraying, but we believe that trouble has not yet begun. Another year preventive methods may be taken, such as securing new ground on which tomatoes have not been planted, omitting the stable manuring, and making sure that plants are set which are not already infected with the blight.

Applying Phosphoric Acid.

What is the best way to obtain phosphoric acid for fertilizing prune trees, and how should it be applied? Am planning to sow muriate of potash and phosphoric acid before planting the cover crop of field peas.—A. B. S., Campbell.

There is difference of opinion as to the best source of phosphoric acid. Personally we would prefer the simple ground bone or rather bone "flour." Next to that we would use the ordinary raw ground rock phosphate. It must be confessed, however, that some of the very best orchardists of the state are still using superphosphate or rock or bone treated with sulphuric acid. Without question the superphosphate is more readily available, giving quicker results, but usually the application of untreated rock or bone will accomplish same results, costs but little more and the results will be obtained for years. It may be applied by drilling in preceding seeding, or broadcasting, at the rate of 400 pounds per acre.

Curtain Front Poultry House.

An inquirer asks for information about curtain front houses for poultry in this climate.

The curtain front house or the drop curtain to be used all the time or only during stormy weather is quite popular in the East and can be used here equally well. There is so little rainfall and no snow storms here so that the curtain would in all likelihood not be used half a dozen times in this climate, but in places where there is considerable rain and the rain would drift in on the hens it is an excellent plan to have a curtain to let down. A wet hen is a sorry thing and a wetting in the night will check egg laying always and often will endanger the hen's life and bring on an attack of pneumonia. So although we advocate the open front houses in this climate, if the house is small and if it is open on the rainy side, by all means take some method for keeping the hens dry. Plenty of air but no draughts, plenty of air but no rain on the fowls at night, this is the way to insure both vigor and eggs.—Mrs. A. B.

Turkey Wings Droop.

What causes the wings of young turkeys to droop? They are about

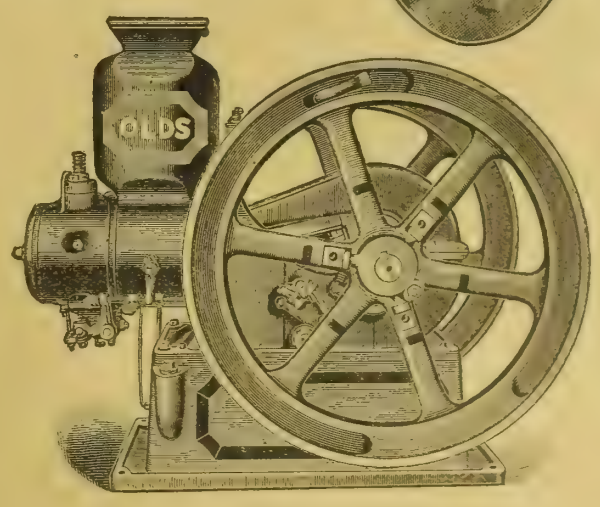
FREE this real leather bill fold for the Head of the Farm

(Not for boys—they're all right and their turn will come later—but this is for the boss.)

Thousands of farmers will buy gasoline engines this Summer and Fall. I want to get in direct and personal touch with every one of them, as I want them to know about the Olds Engine.

If you are going to buy an engine, or are thinking about it, you ought to know what an Olds Engine will do for you. I want to tell you about them—give you just the information you want—so if you will fill out the coupon below (or write me a letter) saying what size engine you want, whether portable or stationary, and when you expect to need one, without asking you to make any promise or obligating you in any way, *I will send you absolutely free* this genuine calfskin bill fold, stamped with your name in gold letters.

It will hold fifteen bills easily. When folded it will go in a small pocket. It is very convenient, handsome and useful; will last a lifetime. Has no advertisement on it.



OLDS GASOLINE ENGINES

are known the world over and used by farmers everywhere. They are the most satisfactory engine made for farm work. I guarantee them to do all we say they will —you to be the judge. Ask any man who has an Olds Engine. He will tell you.

We also make complete electric light and water systems especially for farms.

Write for our prices on corn shellers, corn huskers, feed grinders and cream separators.

If you are going to buy an engine, put a check mark (X) in the place showing the size and style engine you want, and when you expect to need it, and mail to me personally at once. Address me as below.

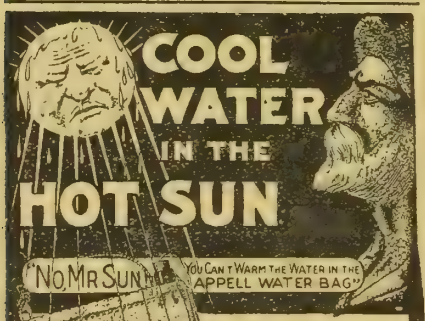
COOL WATER IN THE HOT SUN



APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

Milk Coolers, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

three weeks old and their wings have been drooping over a week. Otherwise they seem all right as they eat well. Can you give remedy?—Subscriber, W. E. H.

The wings of some little turkeys seem to grow quicker than the rest of their bodies and it is well if you notice them inclined to droop to cut the feathers back as far as you can without making them bleed. Some people pull the feathers out but I have never found the need of that. Feed them milk and follow the rules given in the Cultivator for the care of turkeys and you will have no trouble. If turkeys are housed too closely at night the wings will droop and the turkeys become weak.—Mrs. A. B.

Geese.

Do geese breed in water? Is it of any benefit to have water for them to swim in? What is the best variety to raise for the San Francisco market? Where can I get some reading matter about the housing and feeding of geese in California?—H. A. H.

Geese breed in water, but they breed equally well without water to swim in. While it is not necessary to have water for them to swim in, they enjoy it very much and I have no doubt but they really do better, are happier and require less care when they can have a pool or pond or even a good sized tub to wash in. The best variety is the Toulouse for the market. You can get an excellent book published by the Reliable Poultry Company called "Ducks and Geese" at any of the supply houses advertising in this paper. In that book you will find everything you need about feeding, raising and marketing geese.—Mrs. A. B.

Crop-bound.

A few days ago I noticed a Black Minorca hen moping around the yard; her comb was blue and upon examination found her crop full and hard. Placed her in a coop alone and for four days there was no change whatever, though she had no food. Can you give cause and any remedy that could have saved her?—Subscriber, Campbell.

Your Minorca hen was "crop-bound." It is caused by a stoppage in the crop. The food stays there until it putrifies, then the hen dies from blood-poisoning. The remedy is to induce the food to leave the crop either up or down, by giving a dose of castor oil and gently kneading the crop, or by giving half a teaspoonful of bi-carbonate of soda in half a cup of warm water and kneading the crop whilst you hold the hen by the feet with the head hanging down, when she will vomit and often the obstruction and the food will come up. Otherwise the only cure is "with a sharp knife cut through the skin lengthwise of the bird an opening one inch long. Cut only the skin, leaving the crop untouched until the blood of the first incision has ceased to flow, then cut through the crop a little over a half inch long. With a button-hook or anything handy remove the contents. If filled with grass or hay it may be sometimes necessary to cut the mass with scissors before any start can be made. When the crop appears empty put your finger into it and feel if there is any obstruction at the outlet. Wash the crop out. I do this with a syringe. When the outlet is clear the last thing is to sew up the cut. With a needle and white silk thread take two stitches in the cut in the crop, then in the same way take three stitches in the outer skin, tying off the silk at each stitch. Be careful not to include the crop in the knot tied. After the operation feed soft food, omitting grain for a week.—Mrs. A. B.

Freak Eggs.

Please tell me why the almost developed eggs in a hen otherwise healthy are triangular in shape and almost black in color. I have killed several in that condition showing no outward symptoms.—A. P. Z., Coachella.

From your description I should diagnose the case as inflammation or gangrene of the ovaries, but as you do not say in what part of the hen you found the discolored and triangular eggs, I cannot be quite sure. Dr. Salmon says, "It is quite common with all varieties of poultry. The cause of this trouble is not well understood. It has been attributed to birds being too fat." I think it usually comes from insufficient exercise and a too heating diet. The trouble is not discovered until after death, and therefore we cannot prescribe a treatment.—Mrs. A. B.

Feeding Fruit, Etc., to Fowls.

Are ripe tomatoes, melons and green cucumbers good to feed laying hens and chickens? What is the value of a gallon of skim milk for chickens where grain is about two cents per pound?—J. B., Long Beach.

Ripe tomatoes, melons and cucumbers are all good for chickens, fed with moderation and regularly if the vegetables are not mouldy. Some people think that the acid of the tomatoes will stop hens laying, but I have fed them liberally and never found that the case. However, as the tomatoes become plentiful just at moulting time, I think that when hens moult at the time that they are having tomatoes to eat that they may stop laying (as they always do when moulting) and that the tomatoes had nothing to do with it. Melons I have fed plentifully with good results, although the melons some times affect the kidneys of my hens. The analysis of milk shows that in protein value one pound of rolled barley is equivalent to about four pounds of skim milk. There is, however, the casein in the milk and there is something in skim milk that is especialy beneficial to young animals of all kinds. I would suggest that you give half of the chickens the milk and the others no milk until you have proved to your own satisfaction the great value of milk, as personally I have done.—Mrs. A. B.

Tapping Telephone Line.

There is a telephone line running across my place. Does this give me a right to connect with it and use telephone line of my own? If so, how may I connect?—Subscriber, Brice.

You would have no right to attach your wires to a telephone line running across your place. If the line was erected without securing your permission or permission of preceding owner, then it may be considered a trespass, and we doubt not you could prevent any company from running a line over your land, but to attach without securing permission would lead to trouble. Where an attachment is to be made the best way would be to make purchases of the necessary supplies and secure information from the electric man.

Mulberries for Birds.

Have been told to plant mulberry trees through orchards to keep birds from other trees when the mulberries are in bearing.—Subscriber, Covina.

We know this is a general belief, and certainly the birds eat great quantities of mulberries. One serious objection, however, is the amount of room taken by the mulberry trees. They are strong growers and, while not as great soil robbers as some trees, we believe we prefer to chance a regular producing tree with control of the birds in some other way. We will be pleased to hear from our subscribers who have had experience.

F2764. John W. Thomson, 520 S. Main, Los Angeles, Cal.

FARM LANDS FOR SALE.

For Sale—

OWENS RIVER VALLEY

RED APPLE LAND.

Los Angeles' new water supply from the Owens River Valley opens up the most fertile land in all of Southern California. This land is wonderful in its productiveness, beyond belief. Potatoes that run as high as 500 bushels to the acre, with an average of 330; alfalfa, 3 tons to the cutting; timothy, with 10-inch heads; corn, 70 bushels to the acre, and famous for hogs; the world's prize at the Portland Exposition for honey; the finest apples grown on the Pacific Coast, Spitzenbergs and Winesaps, the famous varieties; no better poultry country in California.

No other land in California can compare with it; foothill land with gentle slope, giving perfect drainage; one of the most complete gravity concrete water systems in the State now being installed by men whose irrigating systems in the orange belt of Southern California stand as models for model orchard irrigating. Water from the hundreds of lakes and the high Sierras, giving an inexhaustible and assured supply. The Southern Pacific's new main line to the East now runs through the valley. The choicest apple land will be subdivided into ten, twenty and forty-acre tracts.

The elevation is 4000 feet. Typical California summers, with no intense heat, and with the thermometer at 10 deg. above at the coldest. Practically no rain—about four to five inches during the entire year; 300 days of sunshine, absolutely no fog; has the finest scenery in America; the high Sierras at your very door; trout streams within walking distance. You can leave the valley in the morning, go to the summit of the Sierras, 14,000 feet elevation, camp at one of the beautiful mountain lakes and return to your home the same evening.

This land is not for speculators, but for real serious farmers, who know the value of good land and water when they see them. Will send pamphlet and pictures upon application.

The JAMES R. H. WAGNER CO.,
Room 10,
329 So. Hill St.,
Los Angeles, Cal.

Please mail, without expense to me, your printed matter on Owens River Valley lands.

Name.....

Address.....

For Sale—Rancho Summermont of 44 acres, situated in the beautiful and fertile El Cajon Valley, eighteen miles from San Diego. Ranch is improved with 9 room house with good barn and outbuildings, is irrigated with good well and new engine and pumping outfit, and two and one-half inches flume water. Has 12 acres citrus fruits, about 12 acres in deciduous fruit, shade and ornamental trees, with magnificent palm drives. Balance of land is used for grain. This would be an ideal location for a sanitarium, as well as for a private home. For further particulars address Summermont Ranch, El Cajon, San Diego Co., Cal.

For Sale—

POULTRY

Lasher's Hatchery, 15 Kent St., Petaluma, Cal.—Why my chicks live and grow in the hands of my customers: They are all hatched from free range stock, bred right, mated right, fed right. I have the most up-to-date hatchery building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks; 16 years in the hatching business, 10 years at present stand. It is no experiment or guesswork with me. Am now booking orders for August and later delivery. On account of time and room, will sell all of my Belgian Hares, 200 breeders, young and old. Write for prices on just what you want.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Our Red chicks are hatching strong, only $12 per 100. Do you want Ancona chicks at $15 per 100 or 18c each? How about yearling males at $3 for Leghorns and Anconas; $5 to $7 for R. I. Reds and Buff Orpingtons? Eighteen Leghorn hens and cock for $20; R. I. Red young cock and four hens, $12; Buff Orpington young cock and four hens, $14. Write for our summer price list. Goodacre Bros., Compton, Cal.

For Sale—All thoroughbreds, 200 select White Leghorns, between four and six months old. Getting 30 eggs a day from this lot. 100 White Minorca year-old hens. 50 Rhode Island Red year-old hens. Also younger White Leghorn and White Minorca pullets. Splendid chance to get high grade stock at reasonable price. Cypress Poultry Ranch, Route 2, Box 188, Anaheim, Cal. Take Santa Ana cars to Cypress.

Standard Poultry Yards have the thoroughbred Crystal White Orpington Eggs for hatching, in incubator lots or single settings (from the Cook or Kellerstrass strain). Baby chicks from the same strain from one day to one month old for sale. Prices quoted upon application. E. C. Worden & Son, Props., 4004 University Blvd., San Diego, Cal.

Olsen's White Leghorns. Day old chicks and hatching eggs are money makers for you. They lay and pay because they are bred that way. Book orders now for Fall, Spring and Summer deliveries. Address, Olsen's White Leghorn Ranch, Sunnyvale Cal.

GIVE.

Give, and thou shalt receive. Give thoughts of cheer,
Of courage and success, to friend and stranger.
And from a thousand sources, far and near,
Strength will be sent thee in thy hour of danger.

Give words of comfort, of defense, and hope,
To mortals crushed by sorrow and by error.
And though thy feet through shadowy paths may grope,
Thou shalt not walk in loneliness or terror.

Give of thy gold, though small thy portion be,
Gold rests and shrivels in the hands that keep it.
It grows in one that opens wide and free,
Who sows his harvest is the one who reaps it.

Give of thy love, nor wait to know the worth
Of what thou lovest; and ask no returning.
And wheresoe'er thy pathway leads on earth,
There thou shalt find the lamp of love-light burning.

—Ella Wheeler Wilcox.

HONOR REGAINED.

It was during the last great insurrection in Tonkin. I was at that time a captain in the 93rd regiment of infantry stationed at a small town in the interior. Cholera was raging in our camp and many privates and officers died from it.

Everything seemed to depress our spirits. Never did I hear a single complaint, though many of them had to do hard hospital service week after week. When I had time, I often went to the hospital and helped where I could.

One night I had been working in the hospital since ten in the morning and felt terribly exhausted, when our major surgeon came to me and said: "Look here, Mouvielle, this will never do. You will immediately go home and to bed. You look as if you were just ready to drop."

"It is just about the way I feel," I replied, "and for once I shall take your advice."

I said good-night to the surgeon and when I got home I threw myself on my bed. The next thing I remember was my orderly shaking me to wake me up. I asked him if I was needed at the hospital.

"Yes, captain! It is sergeant Duval, the last cholera patient who wants to speak to you."

"Thank you, Jacques, I will be with him in a moment."

I must have slept for some hours, for it was three o'clock now. The moon was shining into the room and for a moment I stood looking into the peaceful night landscape, but my thoughts wandered to the little hospital and to the man who had sent for me.

Poor Duval! He was a splendid soldier, who had performed wonders during the time of the insurrection and once saved my life at the risk of his own, a deed for which he had been mentioned in the reports and been rewarded with the cross of the Legion of Honor.

I was thinking of this while walking towards the hospital. The surgeon met me at the door and told me that Duval was lying in a little room by himself.

"Go right in to him, Mouvielle," he said, "he asks for you all the time, and I am afraid he will not last very much longer."

I found Duval terribly changed. There was not the slightest doubt that he was dying. He seemed to be asleep, but he heard my steps and suddenly opened his eyes and sat up in bed. Looking at me with a wistful expression he whispered hoarsely: "God bless you, captain, for coming to see me." Then he stopped short and I could see he was in great pain.

"Do you suffer much?" I asked him.

"It is not the pain that hurts me," he said slowly, "but I feel the end coming, and I have something I must tell you."

"I must remind you of the time when I entered the regiment. I had traveled all day from Paris to Marseilles and was almost crushed by a great sorrow. The new conditions of military life did not improve matters and in the evening I sneaked outside the walls. I thought I was alone and knelt down to pray, sobbing like a child. My sobs were heard by a young officer who passed and he came up to me and asked why I was so sad. I told him I had lost a dear friend; and he did all he could to console me. The next day I found out his name, it was you.

"And now I want to thank you for everything you have done for me since that dreadful evening, but there is one thing I must tell you. I said I had lost a dear friend. It was true, captain, but I had also lost my honor, and when you found me, I had prayed to God he would forgive my past and let me win back my honor under a new name. From that day I wore the name Duval, but my real name is Raoul de Brissac."

After a long pause he continued.

"My parents belong to an old noble family in Touraine where I was born. My mother died immediately after my birth. I was brought up by my father until I went to Paris to study law. For a while I worked hard but then I began to gamble and spent, nearly all my time in my club. One night I won 50,000 francs at Baccarat. Then luck changed and when I had lost it all and 7500 francs besides, my friends begged me to stop, I refused and borrowed 1000 francs from a sportsman present. I lost them and left the club. When I finally came home it was seven o'clock. I had three hours to get the money I had lost and borrowed.

"I knew my father had an account at the same bank as I. I forged his name to a check, and had my housekeeper cash it.

"The next day I had a violent attack of brain fever and did not come to for many days.

"Has my father been here, I asked my housekeeper.

"'Yes,' she said, 'I telegraphed for him. He has been with you for a week. Today the doctors said the danger was past and he went home.'

"I understood. In my delirium I had told him everything. As soon as the doctor told me I might go out my resolution was made. I intended to go home and ask my father's forgiveness and then enlist for Tonkin.

"I reached our old home, hurried through the park and looked through the library windows. I saw my father sitting inside, his face buried in his hands.

"I rushed to his side and begged him to forgive me. He took me into his arms and said: My poor boy—my own

poor boy!" I told him I wanted to go away and begin life over again and his voice was broken when he said:

"'My forgiveness you have. But you are right, you must begin life over again, you must win back your honor.'

"He put some bills into my pocket. I saw he had grown old. He asked me what I intended to do and gave me his blessing before I left. The same night I enlisted and the rest you know, captain."

There was a long pause. Then I asked him what I could do for him.

"My father is still alive, captain, and I would like you to go to see him when you go back to France. Will you then give him my cross and my sword and tell him that Sergeant Duval won back Raoul de Brissac's honor. Will you do that, captain?"

I took the dying man into my arms and promised him to carry out his last wish.

I did not return to France for two years, but soon as I landed I went to Touraine and found sergeant Duval's father. He was very weak and had to be carried into the old library. He looked at me in silence for a few moments and then asked me if I had a message for him.

I told him all I knew about his son and handed him the sword and the cross. The old man's sorrow was almost more than I could bear. His heart was broken.

At last I left him and while I walked to the railroad station I thought of the man who had saved my life and thanked God that I had been permitted to carry out the dying wish of him, who had certainly won back his honor. —Journal of Agriculture.

PEROXIDE OF HYDROGEN.

Peroxide of hydrogen is not a medicine or drug, any more than is air and water. Pure water is hydrogen two parts and one part oxygen, while peroxide of hydrogen contains two parts of hydrogen and two parts of oxygen; hence it is the same as pure water, except that it contains one-fifth more oxygen than does pure water. It is oxygenized water. It is the greatest purifier known, a most energetic disinfectant, doing its work better than the dangerous chemicals usually employed—mercury bichloride, carbolic acid, etc. There is positively no danger in it; it can be swallowed without harm, and is safe to keep where there are children. It cleanses and purifies infected wounds, putrid cavities, abscesses, and all diseased surfaces, oxygenizing the poisonous matter and rendering the parts sterile. Cuts, wounds, scratches, burns, and all injuries should be treated with it, as it destroys contagion. Into foul pus cavities it should be injected with a small syringe, continuing the treatment as long as it continues to bubble. Bites of animals, reptiles, insects, should be treated with it at once. Doing no injury to healthy tissue, it attacks pus with considerable energy and bubbling, killing it. Foul odors give way to it. One ounce in a gallon of water is a good disinfectant and deodorizer, and this is excellent to use after a bath, or where perspiration is unpleasant. Used as a mouth wash, it cleanses and purifies, and keeps the teeth white and clean, penetrating every cavity. A teaspoonful to a half pint of water is a good throat gargle, and for catarrh and hay fever. It removes tan and sunburn, whitens the hands, and removes many forms of parasitic growth which cause pimples, etc. It bleaches the hair, and clothing, and should not come in contact with either, as it in time kills the hair. It is not a patented preparation, but is sold by druggists everywhere, just as distilled water is, in bulk, and the price is low.

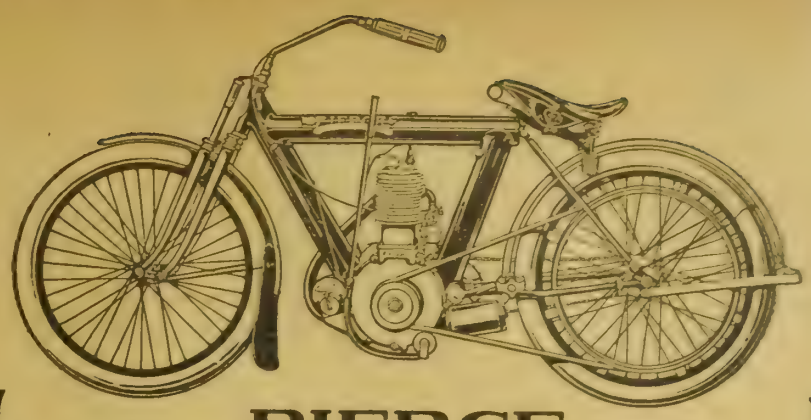
CUCUMBER PICKLES.

Cover the bottom of cask with common salt; gather the cucumbers every other day, early in the morning or late in the evening, as it does not injure the vines so much then as in the heat of the day. Cut the cucumbers with short pieces of the stem on, carefully laying them in a basket or pail so as not to bruise. Pour cold water over and rinse, being careful not to rub off the little black briers, or in any way to bruise them, as that is the secret of keeping them perfectly sound and good for any length of time. Lay them in a cask three or four inches deep, cover with salt and repeat the operation until all are in. Pour in some water with the first layer—after this the salt will make sufficient brine. Spread a cloth over them, then a board with a stone on it. When a new supply of cucumbers is to be added, remove stone, board and cloth, wash them very clean, and wipe every particle of scum from the top of the pickles and sides of the cask. Throw away any soft ones as they will spoil the rest. Now put in the fresh cucumbers layer by layer, with salt to cover each layer. When cask is nearly full, cover with salt, tuck cloth closely around the edges, placing the board and weight on top. Cover the cask closely and the pickles will be perfect for two or three years. Cucumbers must always be put in the salt as soon as picked from the vines, for if they lie a day or two they will not keep. Do not be alarmed at the heavy scum that rises on them, but be careful to wash all off the board and cloth.

When wanted for pickling, remove from brine, taking off weight and board, carefully lifting cloth with scum on it. Wash all clean and wipe all scum off cucumbers and sides of cask. If not all are removed from the brine at once, return the cloth, board and weight and cover closely. Place the cucumbers in a vessel large enough to hold two or three times as much water as there are pickles, cover with cold water (some use hot), change the water each day for three days, place porcelain kettle on fire, fill half full of vinegar (if vinegar is very strong add half water) fill nearly full of cucumbers, the larger first, then the smaller ones, put in a lump of alum the size of a nutmeg, let come to a boil, stirring with a wire or wooden spoon so as not to cut the cucumbers; after boiling one minute, take out, place in a stone jar, and continue until all are scalded, then pour over them cold vinegar. In two or three days, if the pickles are too salt, turn off the vinegar and put on fresh, add a pint of brown sugar to each two gallons pickles, a pod or two of red pepper, a very few cloves, and some pieces of horseradish. The horseradish prevents a white scum from rising. The best vinegar is made from pure apple cider.

Small Cucumber Pickles.

For this none of the gherkins should be more than three inches in length. Lay them in alternate layers with salt in a large crock and pour in enough cold water to cover all, weighting the gherkins down with a large plate, on which is laid a stone. The pickles should be kept in the brine for ten days and stirred from the bottom every other day. At the end of the appointed time pour off the brine and pick over the gherkins. Throw away those that are decayed and soak the others in fresh water for two days. Your next step is to green the pickles by lining your kettle with grape leaves, arranging on this the cucumbers in layers, sprinkling a pinch of powdered alum over each layer. One teaspoonful is enough for a large kettle. Cover the pickles with cold water. Lay three thicknesses of grape leaves over them, cover closely and cook slowly for six hours. Take out the pickles and throw into very cold water. Make a pickle vinegar of four quarts of vinegar, a cupful of sugar, three dozen each of whole black peppers and whole cloves, 12 blades of mace, 18 whole allspice and boil together for five minutes. Drain the gherkins from the water, pack them into jars and pour the scalding vinegar upon them. Keep in a dark closet and do not use for at least two months.



PIERCE
Motorcycles at Reduced Prices

For a limited time we shall offer country riders WHOLESALE PRICES on Pierce Motorcycles. We do this to have our machine known and ridden in even the remotest rural district. Every farmer should have a motorcycle.

Pierce single cylinder and four cylinder models have proven themselves to be the finest motorcycle on the world's market.

ACT AT ONCE——THIS IS YOUR OPPORTUNITY

Ask for catalogue No. 5 and special proposition to country users.

THE PIERCE CYCLE CO., BUFFALO, N. Y.

Hay.

Scott, Magner & Miller say:

Receipts of hay for the week have been 4500 tons. Our arrivals of large consignments by water during the last two weeks have swelled the receipts considerably. Hay coming by cars has not been heavy; in fact, with the exception of Monday, arrivals have been comparatively light.

Market conditions during the week have been a little better than heretofore for the better grades of hay, and there is apparently a stronger undertone which has created a better condition generally.

The poorer grades of hay are very much neglected, and offers of such type do not meet with satisfactory sale as consumers generally have been looking for the better classes and many of them will not take the poor varieties, even at comparatively very low figures.

We have been making sales recently of high type retailing hay on a higher basis than heretofore as this variety of hay has been particularly sought for, and very little has been marketed out of this year's crop.

While our markets during the past week on oats and barley have not been definitely higher than last week, yet the rapid advance to the prevailing high figures which took place last week are now well established and a great deal of trading has been done on the present high basis of prices for both oats and barley. These high figures for feed grains have naturally caused a strengthening tendency.

Alfalfa hay has been arriving more freely and there has been a little more trading recently on this article. Large lots are offering in various sections, but no large purchases are being made.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	16.00@16.50
No. 1 wheat or wheat & oat	13.50@15.00
No. 2 wheat or wheat & oat	11.00@12.00
Choice tame oat	13.50@14.00
Other tame oat	10.00@12.00
Wild oat	9.00@11.00
Stock hay	5.50@6.00
Alfalfa	9.00@11.00
Straw, bale	50@57½

Grain.

Wheat	1.42½@1.47½
Barley, fancy	1.60
Barley, good to choice	1.55@1.57½
Barley, poor to fair	1.47½@1.52½
Corn	1.60@1.62

Shorts	29.00@30.00

Deciduous Fruit Market

SACRAMENTO, Aug. 19, 1911.

Manager F. B. McKevitt of the California Fruit Distributors reports:

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, August 18th, 1911:

Peaches—265¾ cars. As indicated last week, the shipment of this fruit has fallen off quite materially, over 100 cars less going forward than during the previous seven days. Some of the desirable varieties of Clings from Placer County are now offering, McDevitts in considerable quantities and a few Orange Clings. Late Crawfords are nearly finished. There will be very few peaches to offer until Salways are available, which will be about September 1st.

Plums—116½ cars. Plum shipments continue to decrease slowly. Giants, Grand Dukes, Gross and Diamonds, with a few Kelseys, constitute the bulk of the movement. Shipments will probably drop off rapidly after next week.

Pears—301¾ cars. A decline of over 50 cars in this variety is noted from shipments of last week. A further decline during the coming week is probable. Pear shipments on the river are practically completed. Fruit has improved in quality and later shipments will be better than those previously sent out. Some Buerre Mardys are now offering.

Grapes—197½ cars. An increase in the shipment of this variety over last week amounting to practically 50 cars is noted. A further increase is expected next week. Movement of Thompson Seedless is practically concluded, varieties now mostly in evidence being Malagas and Black Prince, with limited offerings of Muscats and Tokays. The quality of grapes this year is unusually good. After next week considerable quantities of Tokays will be available.

Weather conditions are very favorable.

Comparative Statement of Shipments.

	1910.	1911.
Cherries	250½	216¾
Apricots	289¾	214½
Peaches	1623¾	1299½

Citrus Fruit Market

LOS ANGELES, August 23, 1911.

With shipments of oranges ranging from 15 to 20 cars daily the market has been cleaned up and a firm condition obtains at this time. The stock in hand is first class and at the present rate of picking the season will end with practically all fruit shipped. By the first of September there will probably not be over 1200 cars in California. This will be an average of 20 cars daily.

Cream Separators, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

MILK STRAIN

Petaluma Cal

Lemons have a firmer tone, though there are are approximately 39,000 boxes of foreigns on the pier in New York. The number afloat, however, is only about 7500. This number of foreigns rather tends to lower the possibilities of low grade fruit, but as they are old the demand is anything but keen.

Shipments.

Shipments of oranges to date since November 1st, 1910, 35,316 cars, lemons 6038 cars, total 41,354. To same date last season: Oranges 24,251 cars, lemons 4278, total 28,529.

NEW YORK, Aug. 21.—Seventeen cars Valencias, two cars lemons sold. Market strong on Valencias, prices slightly higher. Market also higher on lemons. Weather fair.

HOW TO REFINISH AN OLD CHAIR.

An old oak chair can very easily be refinished with only one coat of material. The necessary time taken for this work by the housewife would be very insignificant. A chair of this character will be found in nearly every household, and it will usually be badly scuffed and worn. These badly scarred surfaces should first be sanded lightly with 00 sandpaper; one sheet at one cent will be quite sufficient for this purpose. The sandpaper will usually turn the old varnish white, but this effect will entirely disappear when the new finish is applied. All dust and loose particles should then be removed and the chair is ready for one coat of varnish stain, dark oak. A chair of this sort will require about one pint of the stain, and it should be applied with a soft bristle brush. This stain is ready for immediate use. It should be well brushed out, so that the grain of the oak will not be entirely obliterated. Start at the bottom and work up, so that the chair can be moved easily without touching the finished parts. A still more durable finish can be obtained by applying a second coat of a durable varnish.

The varnish stain will dry thoroughly over night and produces a very durable finish for all kinds of furniture, woodwork, floors, etc. It is made in cherry, dark oak, ebony, green, light oak, mahogany, rosewood, walnut and ground. One pint of the stain and one sheet of sandpaper is all that is necessary to make an old chair like new.

TRY TO WORK THINGS OUT.

If you get the worst of it some way
And feel inclined to raise a row,
Just smother what you'd like to say
And try to work things out somehow.

—Chas. H. Meiers.

There is no duty we so much underrate as the duty of being happy.—R. L. Stevenson.

P & O

SUCCESS PLOWS

A plow that has been on the market for years without a change in its construction; a plow that was so well built at the start that no changes have been necessary; a plow that has the largest sale of any riding plow made; a plow that is so simple it cannot get out of order, so strong that it lasts a lifetime—

Such is The Success.

It has the strongest and simplest frame ever put on a riding plow; the best hitch, the best landing device, the best rolling cutter, and bottoms ever made. It has but two levers, but they give the same wide range of adjustments as plows with three or four levers.

The **Success** is heavier; it has more material, but fewer parts, and therefore less complicated, than others. That is why it is simple, strong and durable. That is why we call it the **Success.**

The Success is a medium-priced plow that will work anywhere, and it is backed by an unqualified guarantee. Why buy a high priced plow when you can accomplish the same results with the Success, a medium-priced plow?

When so ordered, we furnish Alfalfa Shares, which are broader than the ordinary shares.

Insist on getting **P. & O.** Canton Plows, Harrows, Planters, Cultivators, Potato Diggers, Stalk Cutters, etc., from your dealer. Send for Catalog C 76

No Death Traps
In the Layne System

The Layne Patended Steel Pit is a Safe Pit

Workman Falls 90 Feet To An Untimely Death

Falling down a ninety-foot shaft in some mysterious manner while at work at the Buena Vista pumping station in Elysian Park, E. J. McComb, 67, a veteran employe of the water department, was killed at about 5 o'clock Friday morning. The body fell into the water at the bottom of the shaft, and was not recovered until 7:15 o'clock Friday morning.

No one witnessed the accident, but it is believed that the man lost his balance while at work at the top of the deep shaft, and fell, striking the circular stairway inside of the well as he fell.

Fell Into Water.

The shaft leads to a tunnel under the Los Angeles river. The tunnel is filled with water forty feet deep. Work was immediately started to pump out this water, and the body was reached after two and one-half hours' work. Coroner Hartwell was immediately notified, and the body was taken to Pierce Bros.' undertaking establishment.

McComb had been an employe of the city water department for twenty years. He served under the late President McKinley when the martyred president was a colonel. When McKinley visited Los Angeles, while president, he sent for McComb, and the two visited for a long time.—News Item.

No Open Pit

No going down into the pit to tighten bolts, pack boxes, grease bearings, etc. All lubricating and adjusting is done from the outside at the pump head above the ground.

Sand Kills Other Pumps

but does not affect the

Layne Pat'd Centrifugal Pump Screen and Steel Pit

Chico, Cal., July 26th, 1911.

Frost Prevention Co.,
San Francisco.

Dear Sirs:

In reply to yours of the 25th would say that there ought to be good sale for the Bolton Orchard Heater this year as they have proven a success during last spring's frost. I have used the heaters four years. In 1908 I had 80 per acre in apricot orchard, none in the almond orchard, just across the road. There was no sign of frost in the apricot orchard, and the almonds froze off clean. This year (1911) I had the heaters in the almond orchard and none in apricot. Apricots froze clean except a few in tops of trees 18 or 19 feet from ground. No sign of frost in almond trees. N. C. Jessee and A. Gee both used heaters with the same result. These three orchards contain nearly all the almonds for quite a large scope of country. I think this proves all you claim for the heaters. There was no need to use them in 1909 or 1910. Yours truly,

(Signed) H. Losee,

Medford, Oregon, U. S. A.,
July 25, 1911.

The Frost Prevention Co.,
San Francisco, Cal.

Gentlemen:

Replying to your favor of the 18th inst., beg to state that we used about 3,500 of the Bolton Orchard Heaters during the past season and though there were several mornings that the temperature was as low as 24 degrees, we pulled out a crop of about thirty-five carloads from fifty acres. There were seven mornings, any one of which would have practically annihilated our crop had we not been equipped to fight the frost. We expect to equip another fifty acres for the coming season, and while we dreaded the magnitude of the undertaking, one hundred acres does not look as large to us now as fifty did before we undertook it. Yours very truly,

THE BEAR CREEK ORCHARDS.

Toboso, Licking Co., Ohio.
July 21, 1911.

The Frost Prevention Co.,
San Francisco, Cal.

Dear Sirs:

We used the small heaters for three evenings. We did not have the frost that we sometimes have, but cold enough that all blossoms where we did not use the pots were killed. We only lighted every third pot, which raised the temperature six degrees. Six hours has been the limit as to time of burning them. We used fuel oil from the Standard Oil Co. We have just tried an experiment with the crude oil from the well, as we have several wells of our own, and find that it burns equally as long as this fuel oil. Yours very truly,

H. A. ALBYN.

Owensville, Ind., April 3, 1911.

Frost Prevention Company,
San Francisco, Calif.

Gentlemen:

In reply to inquiry from your local agent, the writer begs to advise you that three thousand of your two-gallon Bolton Smudge Pots were used in his orchard during the past spring and were eminently satisfactory. While the cold weather here was not excessive, still the writer lit about one-third of the pots on three nights and found that number ample to control the temperature in his 45 acre orchard. By actual test, the pots burned from eleven to thirteen hours, according to the wind conditions. The writer selected this pot after testing out several of the most prominent makes.

Yours very truly,

(Signed) A. HANNY.

Give the Pomona Patent Pressure Gate a Trial

No rubber or wooden facing to rot or wear out. Absolutely water tight when closed. Locking mechanism is protected against rust or clogging with sand or dirt. Simple in construction. Cheap in price and as durable as solid iron.

THE LOCKING DEVICE is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

ALSO A FULL LINE OF CIRCULAR VALVES FOR ORCHARD AND ALFALFA IRRIGATION CARRIED IN STOCK.

Write for descriptive circrcular and price list.

Model 44

Imperial Models for 1912

Our motto has been "The Get There Kind," and the 1909 and 1910 and 1911 lines of Imperial Cars have become so famous for quiet and beautiful operation, remarkable flexibility and superb hill climbing capacity, that we feel proud to introduce to you our innovations for 1912. Model 43, a snappy and racy looking gentleman's roadster, shown below, without a peer on the market; Model 44, above, our semi-torpedo, five-passenger, fore door touring car, with its graceful and beautiful lines to recommend it to any connoisseur. No expense, time or effort has been spared to produce a highly artistic, practical and refined product. Going beyond outside appearances, Imperial power plants are free from superfluous parts—are capable not only of developing power smoothly, easily and without strain, but with reciprocating parts utilizing every ounce of power when the maximum is needed.

Absolutely Guaranteed

Arnott & Company have taken on the Imperial line as a permanent addition to their other high grade agencies. The high standing of this company attained during the last eighteen years is guarantee that these cars are right in every way. We have eight sample cars on exhibition and solicit the most rigid examination, especially from buyers who are now purchasing their second car and who will recognize the high grade of the "Imperial."

We want an energetic owner-driver agent for this line in each community and can offer a most liberal agency contract that will justify giving us your entire time in selling these cars at a handsome profit. Write today for catalogue and if you are in position to act as agent let us know.

How Much

are Your Buildings and Contents Worth?

Are They Worth 35 Cents?

Yes, this is said seriously. Don't you know that the average farm fire is a total loss? Yet ninety-nine fires out of every hundred could be extinguished if proper equipment were at hand. What would you do if fire were to break out in your farm buildings tonight?

THE MAGIC EXTINGUISHER

will put out ninety-nine out of every hundred of these fires.

To operate it, turn it upside down.

It throws a chemically charged stream forty times more effective than water to a distance of 50 ft.

It costs $12.00 delivered at your nearest railroad station.

It can be used any number of times and when emptied can be re-charged at a cost of 35 cents.

Think of the additional security if you had one of these on each floor of your dwelling and in each building on your ranch. Can you afford to take the risk of losing any of your buildings that an expenditure of 35 cents might save?

Order extinguishers today for each building on your ranch.

125-127 O St. Sacramento,

California Cultivator

Vol. XXXVII. No. 9. LOS ANGELES: THURSDAY, AUGUST 31, 1911 One Dollar the Year

The Nitrogen-Gathering Value of the Legumes

While the Value of the Legumes for Green Manuring Has Long Been Known, it Has Remained for the Orchardists of California to Extensively Practice This Method of Fertilization, and the Results Produced Justify its Further Extension

It is known that the Romans used
e clovers for improving soil fertil-
y many years ago. Doubtless they
d not understand the whys and
herefores as well as the farmer of
day, but they did know that they got
sults. The farmers of the East have
served for many years good results
llowing a year or two of clover, but
seems to have been left for the
lifornia orchardists to reduce green
anuring to a science by the use of
gumes. For a score of years this
ethod of enriching the soil has been
llowed and we believe every year
s seen a material increase in the
actice. Probably it has obtained a
eater hold in citrus orchards than
deciduous, but even with deciduous
it growers the practice is increas-
; and would increase with greater
pidity were the deciduous orchards
the northern part of the state but
pplied with irrigating water which
ld be used at planting time. Some
the first green manuring crops were
natural growth of bur clover and
laria, rye and brome grass. This
to the adding of humus, the con-
vation of moisture and the benefit
the mechanical condition of the
. Later soil physicists developed
fact that former methods of soil
provement could be supplemented
h teeming millions of bacteria
ch would aid the agriculturalists
gathering the most expensive ele-
nt of plant food, nitrogen, a perfect
an of which surrounds the earth.
we have never considered that
great supply could be made avail-
for the use of the soil. Science
proven that this bacterial life has
power of grasping this nitrogen
making it available for the growth
family of plants called legumes.
family includes the clovers,
ns, peas, vetches, lupines and
y others.

ne most extensively used of these
mes has been the Canada field pea
the common vetch. The latter
h have been used more generally
not a combination of vetch seed
ucers in the Northwest made the
e almost prohibitive for manuring
oses. Enterprising seed men in
southern part of this state have
ly overcome this combination,
ever, and are now importing ship-
s of seed from Germany. This has
lted in securing the seed at much
satisfactory prices.

ing Time.

e most successful growers of
n manure crops sow vetch and
clover during the first half of
ember if possible to get the water
at time to properly fit the ground.
may be sown the latter half of
ember or even much later, but
arly seeding has such an advan-
tage that where possible the seed should be put into the ground to take advantage of as much growth as possible during the warmer days of early fall. With the walnut trees the grower is at a disadvantage because he must have clean ground for the gathering of his crop, and cannot sow till later. Before sowing the ground should be given a very thorough irrigation. It is then plowed or disked, harrowed down and the seed usually drilled in. Some, however, prefer broadcasting and harrowing. Immediately following the seeding the land is prepared for irrigation. This is usually done by the furrow method, although walnut growers sometimes prefer the basin method. If the former, a number of shallow furrows are laid between the rows of trees in the direction in which the water flows. Of course no cultivation is given or other care than the occasional irrigation, and this is timed according to the rains, but some growers are so anxious to fill their soil with moisture that rain or shine the irrigation is maintained through the entire winter season or until the time for turning under arrives.

Plowing Under.

Turning under should be not later than February in the citrus orchards of the South, while in the northern deciduous orchards a little later may be more desirable. In a citrus grove later than this would bring the plowing well towards or into the blossoming season, and the feeling obtains with practically all citrus growers that plowing at blossoming time is objectionable. The turning under may be with the ordinary moldboard plow, though the disk plow has gained in favor each year. It may be added also that the use of the disk is more satisfactory on sandy soils than heavy. For heavy soils the plow should be used. Some who are loath to disturb the soil deeply on account of interfering with the function of the surface roots, have used the ordinary disk harrow after crushing down the rank growth of the green manure crop. This cuts up and distributes the tender growth of the legume in the surface soil and probably does not give such complete decomposition results as when plowed under deeper. We doubt not that there is greater loss from burning out during the summer months than where more deeply covered.

Harrowing.

After plowing under the land is harrowed, care being taken that the teeth are set so as to drag over the surface rather than to catch and drag out the freshly plowed under crop. If the ground is filled with moisture and the growth has not become dry and hard, decomposition begins at once and in a short time deep cultivation may be given. After turning over the green manure the cultivation cannot be too complete, and on sandy soil especially, every effort should be made to compact it as much as possible.

Inoculation.

We noted the fact that it has been found that millions of minute life join in making this green manuring of greater value. It has been developed, however, that some soil seems to be entirely deficient in the particular form of bacteria which will work upon certain of these crops. That is, a soil which has grown alfalfa successfully may be deficient in the bacteria which induce strongest and best growth of peas or other legumes. These bacteria locate upon the roots of growing plants and cause growth of nodules which might be taken for an excrescence or a disease, but it has been shown that the legume which shows the greatest number of these nodules shows the darkest and richest growth of top. This has been found to be because these nodules are at places where the atmospheric nitrogen is gathered in and made available for the use of the plant. Therefore, a soil condition must obtain which will freely admit the atmosphere into the soil.

Where this deficiency of the beneficial bacteria is observed, science has come to the rescue and prepared cultures which have been used to transfer to the soil sufficient of the bacteria to render the assistance required. This was carried to an extreme at one time and through exaggerated claims made for the virtues of this method many obtained the idea that one could carry in a capsule in the vest pocket a culture which would fertilize a ten-acre field. It is true, however, that the cultures may be produced artificially and introduced into the soil through sprinkling of seed to be sown over soil and the soil afterwards applied to the field. The more general method which obtains at present, however, is to secure soil from a field which has successfully grown the particular legume in question, which is moistened slightly and mixed with the seed or applied direct to the field during seeding time. Some striking results have been obtained by introducing the culture in a portion of a field and withholding it from another. This has shown conclusively the beneficial effects of inoculation.

In Bulletin No. 190 of the Bureau of Plant Industry, engravings are shown of the fields at Chico wherein horse-beans show vastly greater growth on the inoculated portion of the field. The same crop, however, in Southern California does not seem to need inoculation.

Cover Crop Experiments

By J. H. Norton, Citrus Ex. Sta., Riverside.

"Of what value is the cover crop nitrogen?" is a question often asked and with no definite answer up to the present time, and this article is not intended as a final answer to this question. But at this season of the year we are seeking all the information we can get on cover crops and any hint of an answer to this question should be put forth.

In the fall of 1909 this station undertook the field work on the solution of this question. The first year's work did not give satisfactory results owing to various experimental errors that have since been eliminated. This year's work seems to have some very promising figures in store and it is certainly not out of place to anticipate these figures.

This experiment was commenced by surveying out seventeen plots, 20 feet by 200 feet, side by side, and numbering them from 1 to 17. In the fall, about the first of September of each year, these plots have been sown to their respective cover crop, following much the custom of cover crop practice in the groves. The odd numbered plots contained the leguminous cover crops, a different variety on each plot, while the even numbered plots contained a non-leguminous crop, barley. In the spring at the usual time for plowing under cover crops these plots were plowed, turning the crop to a depth of about nine inches with an eighteen-inch moldboard plow. Annual non-leguminous garden crops were planted across these plots and account taken of the growth of each annual crop on each of these plots with the point in view of determining the value to the soil of each of these cover crops. On half of the barley plots various amounts of nitrate of soda have been used so as to be able to get these benefits in terms of nitrate of soda. In the summer of 1910 ten varieties of garden crops were planted, but trouble was experienced in growing so many varieties on so small an area, and, besides, many of these crops did not respond well to the nitrate of soda. In the summer of 1911 three garden crops only were used.

COVER CROP EXPERIMENTS.

(Continued from Page 193.)

These three crops represent the three parts of plant growth. The corn crop, the ear itself represents the influence of these various cover crops on the production of the fruit of a plant. The cabbage represents the effect of cover crops on the production of plant growth, while the mangels represent the influence of the various cover crops on root development. Then, having the three parts of plant growth represented, and with no other information to draw on, is it not fair to conclude that whatever effect is produced on these garden crops will be produced on citrus groves? Our equipment is not great enough to undertake this experiment in the citrus groves at present and besides the garden crops give quicker returns for the experiment.

No harvesting of these garden crops has been done up to the present time except two of the three varieties of cabbage used. Judging from the figures already obtained, as well as the appearance of the remaining crops, we seem to have the following results. The figures used in expressing the yields of cover crops are calculated to the acre basis and are weights of the tops of the green crop cut at the surface of the ground.

The yield of the garden crops is not as good on plot 10 following barley, 12½ tons per acre, where 1080 pounds of nitrate of soda (162 pounds of N) has been used, as it is on either plots 11, following Tangier peas, 18 tons per acre, or plot 9, following Canadian field peas, 15½ tons per acre. This 1080 pounds of nitrate of soda on plot 10 is the highest amount of nitrate used on any of the barley plots. Plot 10 has slightly better garden crops than any leguminous cover crop plot, except the two mentioned above. The garden crops following barley where various amounts of nitrate of soda have been used are quite consistent with the amounts of nitrate used.

Then rating the value of the various leguminous cover crops, judging from this one experiment and one year's results, I would place field peas (15½ tons) and Tangier peas (18 tons) on a par, followed by melilotus indicum (15½ tons) and fenugreek (12½) tons; then following these in order I would place lentils (15 tons), improved vetch (U. S. Dept. of Agr., B. P. I. 13410, 16 tons), burr clover (13 tons), and common vetch (12½ tons).

The reader must remember that he is not producing the yields of cover crops as have been given in this paper for reasons that you are growing your cover crops in groves where only about half the soil is producing cover crop, and it is not possible to be able to care for the crop on a commercial basis as has been done on these small plots. So do not deceive yourself into believing that the nitrogen in one acre of your cover crop is equivalent to 162 pounds of nitrogen applied in some commercial form. Determine accurately what yield of cover crop you are producing; then experiment station work along these lines will be all the more valuable to you.

Cover Crops for Vineyards and Deciduous Orchards

By Mrs. M. E. Sherman.

The use of cover crops to increase the fertility of the soil is not new in horticulture, for back in the countries of summer rainfall or those known as humid, for many years the farmers have plowed under a clover crop to increase the richness of the soil. This use was empirical and only when the subject became a matter of scientific study was the value of humus understood. The past fifty years has given us much research work into the soil and into conditions of plant growth. The impetus given by the profound studies of Darwin directed the student mind first to animal life and then in following down to the lowest forms, it was found at times that the vegetable life was divided from it by a line so invisible that it was sometimes impossible to decide whether a growth belonged to the animal or vegetable world.

Desert Soils.

As Dr. Shaw has coined the appropriate phrase "Humus the minus quantity in our soils," that fittingly covers the reasons for using cover crops. The content of humus is low in arid countries all over the world. The reason for this is that the natural growths are shallow rooted annuals. These spring up miraculously from the seed in almost a day, when the rains fall lightly on the parched ground. These plants rush along to blooming and seed-making during the time of moisture. When the water in the soil has been exhausted, the field turns yellow, then brown, while the warm wind tugs at the dried stems and withered leaves until they are blown away in tiny fragments. They do not rot and form humus in the soil after having been beaten down into the earth by showers. After this dessication of the plants by the air the portions left are too dry and mineral to be of use to plant life. The early farmers of wheat found out that the turning under of the dried stubble was distinctly a detriment to the next crops, as the straw did not rot and only helped to dry out the soil. The old grain farmers will tell you of plowing up land that had lain without a crop for four of five seasons and finding the bright unrotted straw safely tucked away in its little bed unharmed by the rain storms. The reason then for burning off the stubble, that looks wasteful to the farmer from the East, where the summer rainfall is abundant, is one that has been founded on long experience. We cannot look for increased fertility of soil in California in turning under a cured crop. Even the strawy portion of manure is often not rotted when spread late in the winter time.

Cover Crops.

Cover crops in California must be those that can be grown and disposed of in the winter time, as the use of water to irrigate in the summer is not advisable except in fruits like oranges, lemons and olives. The deciduous orchard and vineyard ripening their fruit require summer harvesting, open spaces and summer growths are interfered with seriously. There is a cheap way used somewhat in Fresno County of planting peach orchards to alfalfa. The orchards are old ones

and on poor, sandy soil. The constant irrigation of the alfalfa has helped them greatly. The principal objection to this is the gophers that work on the roots of the trees as well as the fact that the hay made in the orchard is worth all it will sell for to handle. I would not take a crop of alfalfa hay in the cocks in an orchard as a gift; as the cost of carrying it out in forkfuls to the wagons is too great.

Field Peas.

The winter growth of Tangier and common field peas has been good with us. The expense of the seed is heavy and for this reason the crop has been limited to the amount of seed we produced each season on the plot set aside for this purpose. The labor of getting the seed into the ground has been helped by a simple way of adding it to the manure hauled out in the orchards. When a manure spreader is used the sowing is even and the results better than where the manure is thrown off in chunks. The land in the orchard is in a well cultivated condition and with the manure on top it forms a moist mulch to hold the rainfall and dew. We usually have a few showers in October and November that start the peas growing and then the dews will keep the young plants watered.

It may be observed that in the fields here and there are bunches of volunteer barley that is heading out by the time the sown barley is first peeping out to tinge the brown earth faintly with tender green. This early maturing barley was simply seed that was ready in the ground to grow with the first moisture. Now by observing the same conditions with the cover crop we can secure a like growth. There is a further thought here that the manure used helps the peas to push along and is in turn made into the best possible shape for rapid rotting.

In the Vineyard.

The Malaga grape vineyard can be handled in the same way by spreading the manure after grapes are gathered. The raisin grape and Emperor come so late that this is not practical. We have scattered the bur clover seed over the surface before the pickers came and allowed the tramping to put it into the ground. A few Tangier peas used in the same way gave good results as they bloomed before the plowing reached them. I am giving this suggestion in hope others will try it, there may arise unseen objection to the practice on further trial. In all farming operations the season has much to do with success and we can only work on the line of average results. If we can sow the cover crop without additional labor of plowing or cultivating the land we can afford to have more of them to plow under each year.

Beware.

There are bewares in every business and one of the greatest in handling a cover crop is that of letting it grow too old. I have seen so many people let a cover crop get ahead of them. It is detrimental instead of helpful to plow under a mass of dry stems and leaves. As soon as the bloom begins to form start the plows to running. The growth must go under green or it will repeat the experience of the grain farmers by turning up unrotted and act as a dryer to the soil. Better put it under a little too green than too dry. In our California soils sourness is not feared. We have too much alkali and can turn under

more green stuff and keep on doing it than would be proper in the East. So far no one has made the land sour in California with green manuring.

Suggestions.

I have not gone into the merits of the various plants for cover crops, but have mentioned those we have had in use. There are many others of equal merit as nitrogen producers and humus makers. In practical ranching the cents are counted and the plants that give us best growth are sometimes not available from the money standpoint. The winter vetch seed has not been obtainable at any price much of the time with us. The bur clover is a natural growh with us and we know that every dollar invested will make returns, for if it is once planted, every winter will bring it into a heavy growth. In the older portion of the San Joaquin Valley we have tried many new plants and after all, the only really bad one that has been started there is the Johnson grass. With the peas and vetch we are safe from introducing anything that will prove a pest later on. I often think we run too much after new things rather than trying to improve those we have by developing them to perfection.

EASY MONEY FOR THE DAIRYMAN

Your money comes directly out of your cows. It makes a wonderful difference to your pocketbook whether your cows produce much or little. Have you ever realized what even one quart a day more from each cow means to you? Say three cents a day—that's more than $10 a year. With only ten cows it means $100 a year. Looks pretty big all in a lump, doesn't it? Now it's just "easy money" to get that extra quart, and oftentimes, two quarts, by a simple and cheap change in your feed.

We are blessed in this country with nature's richest gift—"Alfalfa," which we all agree is an unrivalled feed for a dairy cow—but even the best should not be used alone—cows, just like human beings, need variety. Alfalfa is rich in protein, but is light in carbohydrates. A cow, in order to make the most milk, must have in her ration a sufficent amount of both classes of feed.

STEAM DRIED BEET PULP
Just Like Roots
MAKES MORE MILK

In Steam-Dried Beet Pulp is found the ideal combination with alfalfa to make a properly balanced ration. It is light, bulky, succulent and easily digested, absorbs water very quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley and produces better results.

The combination we recommend is 8 lbs. of Steam-Dried Beet Pulp with all the alfalfa hay the cow will eat, which will be from 15 to 20 lbs. daily.

It has also proven to be a splendid green food for poultry. They are extremely fond of it.

Steam-Dried Beet Pulp is just the clean beets from the sugar factories (only the sugar extracted), which is **dried by steam.** Be sure you get the kind that's **Steam Dried,** always uniform in color and quality, never burned or blackened by smoke, always clean and pure. It is packed in 100-lb. sacks and will keep indefinitely.

Progressive feed dealers are rapidly placing Steam-Dried Beet Pulp in stock. Ask your dealer for it. If he does not keep it, write us.

The Larrowe Milling Co.

Favorite Green Cover Crop

We recently asked Mr. O. M. Morris of the Morris and Snow Seed Co., as to the different legumes which are grown for cover crops and the amount of seed per acre. He answered us:

"Very few cow peas are used as cover crop, principally Canadian field peas, vetch, bur clover and to some extent fenugreek. Lupins are almost too expensive to be very popular as a green cover crop, although they are used to some extent in France for this purpose. Some growers around Rialto are having good results with dwarf Essex rape, but probably 65 to 70 per cent favor the vetch and they will commence planting this from the last of August and continue up until the latter part of October for citrus groves. For walnut groves they generally sow it in dry and depend upon the rains instead of irrigating, but we would advise irrigating and planting it much earlier in the walnut groves where it is possible and plowing it under during the wet season and avoid considerable trouble in the conquering before the dry season comes on. However, it can be planted if irrigated, at any season of the year. We recommend 40 pounds of vetch, 60 pounds of peas or 15 to 20 pounds of bur clover to the acre.

"Any of these cover crops increase the nitrogen in the soil and of course naturally increase its fertility for beets or any garden truck and we believe it has proven entirely satisfactory as this green crop can be grown during the winter without much loss of time to other crops. Any of these crops can be planted as soon as the cover crop is sufficiently rotted down to allow seeding.

"These cover crops have a double advantage by filling the soil with roots and increasing the humus besides the nitrogen they store in the soil."

* * * *

Along the same line Mr. Aggeler of Aggeler & Musser informs us:

"Before the nitrogen producing plant was thoroughly understood winter rye was the principal cover crop. This produced the humus but not the nitrogen. At present vetch is chiefly used for this purpose because if planted at the proper season it would produce more humus and as much nitrogen as any other crop used for this purpose. The principal crops for producing nitrogen are vetch, Canadian peas, fenugreek, bur clover, mellilotus and cow peas, of which there are several varieties. The vetch should be planted before the first of November, even as early as the first of September in order to give it plenty of time to develop a full growth. Bur clover, mellilotus and peas should be planted from October 1 to January 1.

Peas are preferred for late planting in walnut orchards. Our observation of fenugreek would indicate that it thrives better on heavy land than on sandy land. Vetch, peas and fenugreek should be sown like grain with a drill. This makes irrigation easier and more thorough than sowing broadcast.

"We have made several attempts at growing peas and vetch for seed in Southern California, but even under favorable circumstances the yield is too small to make it profitable. Up until last year all of the vetch sown in California was grown on the Pacific Coast, but we found a cheaper market."

Improving Sandy Soils by Growing Forage Crops

In farm management the maintenance of soil fertility is always a most vital problem, and on lands sufficiently fertile all that is necessary to prevent deterioration is to hold the crop producing power of the soil at the same level. Adequate fertility in soils, however, is not very common, and generally the first question is how the fertility may be increased. The methods of soil improvement vary with different kinds of soil, and the difficulties encountered are largely determined by the soil character. Light soils, for instance, are usually much more difficult to improve than similarly located heavy soils. A consideration of this subject, together with the results secured in the improvement of the sandy soils in south Jersey by means of growing forage crops, has recently been presented by E. B. Voorhees and J. G. Lipman, of the New Jersey Experiment Station.

In discussing the general character of light soils, the authors point out that unimproved sandy or sandy loam soils can not furnish as much plant food or supply as much moisture to growing crops as the clay and clay loam soils are capable of doing. Attention is further called to the fact that the coarseness of sandy soils prevents them from readily retaining the plant food applied to them and the moisture they receive. The fertilizers given are easily washed downward into the subsoil by the rains, and dry weather soon robs these soils of their moisture. Extremely open or coarse, sandy soils are considered amenable to profitable cultivation only when rainfall is abundant and well distributed, the subsoil sufficiently compact, and the water table near enough to the surface.

In treating of the physical properties of sandy soils, their relation to moisture, heat, and air is discussed. It is shown that owing to their great permeability sandy soils may be tilled early in the spring, when heavier soils are still too wet to be worked. They are earlier and warmer than heavy soils because they are drier. On the other hand, these loose and open soils quickly lose their water by both percolation and evaporation, and at the same time, on account of their limited capillary power, are unable to replenish this loss rapidly by drawing upon the water supply of the subsoil. In the heavier and more compact types of soil capillarity is much more active.

The openness of light soils admits air freely and thus intensifies the chemical and bacteriological changes going on in the soil. Under these conditions plant food is made available more quickly and the rock particles weather more effectively than under the conditions obtaining in a heavy soil, but these processes are carried on so rapidly that the humus burns out too fast and the losses of plant food are too great.

Bacterial Activity.

Chemical studies of the sandy soils of south Jersey reveal for the most part their poverty in plant food. Some

soil samples examined contained as much as 98 per cent of pure quartz. Lime was found in small quantities, magnesia and potash in traces only, and the proportion of organic matter was also very low.

It is stated that the bacterial activity of soils is directly influenced by the supply of air, moisture and warmth, and by the chemical composition. Well-aerated or open soils favor the development of bacteria requiring large quantities of air for their growth, and these species cause an intense decomposition of the humus. This is offset to a great extent by the rapid loss of water from these soils, as the bacteria can not multiply when the soil moisture falls below a certain point. In the heavier soils not so well aerated and not so readily affected by dry weather, the changes in the development of bacteria are not so sudden, and therefore the supply of plant food, and especially of nitrogen, is much more uniform than in the open sandy soils.

Secure Humus.

For the improvement of sandy soils it is recommended that thorough aeration be discouraged by methods of tillage, by applications of fine-grained materials or of substances readily pulverized, and by additions of large quantities of humus-forming matter such as green crops or barnyard manure. Sufficient humus in the soil prevents the too ready access of air and increases the moisture-holding capacity of the soil. Although sandy soils are quite poor in plant food this condition does not preclude the possibility of their improvement. Phosphoric acid and potash may be supplied at a comparatively small cost and the humus may be furnished in either animal manures or green manures. In considering this phase of the work the authors show that the use of animal manures is not indispensable. They regard horse manure as too expensive for general farm crops, because it is not always handy and also as injurious in some cases through the introduction with it of weeds and fungus diseases. The experiments they conducted were made with a view of showing that the humus content of sandy soils could be increased by means of green manuring and the use of fertilizers alone. Systems of green manuring were found particularly effective in this connection on account of the relatively greater need of nitrogen and humus in light soils and their greater power to convert green crops turned under into available plant food. Leguminous crops, such as crimson clover, cowpeas, soy beans, vetches, etc., are recommended for this purpose because they add both humus and nitrogen to the soil. The limitations of green manuring enumerated are the use of large quantities of water by the crops, the need of an abundant supply of phosphoric acid, potash, and lime in the soil, and the drying effect of the green crops when plowed under. Where the rainfall is sufficient the disadvantages of green manuring are largely reduced.

With reference to the activities of germs in the soil it is stated that by increasing the amount of humus in sandy soil its water holding capacity is increased and thereby a more uniform bacterial development and a more uniform supply of available plant food assured. The increase of humus in sandy soils encourages the growth of bacteria as a result of the greater content of organic matter and of moisture, and their development is discouraged on account of a less thorough aeration of the soil.

Beneficial Bacteria.

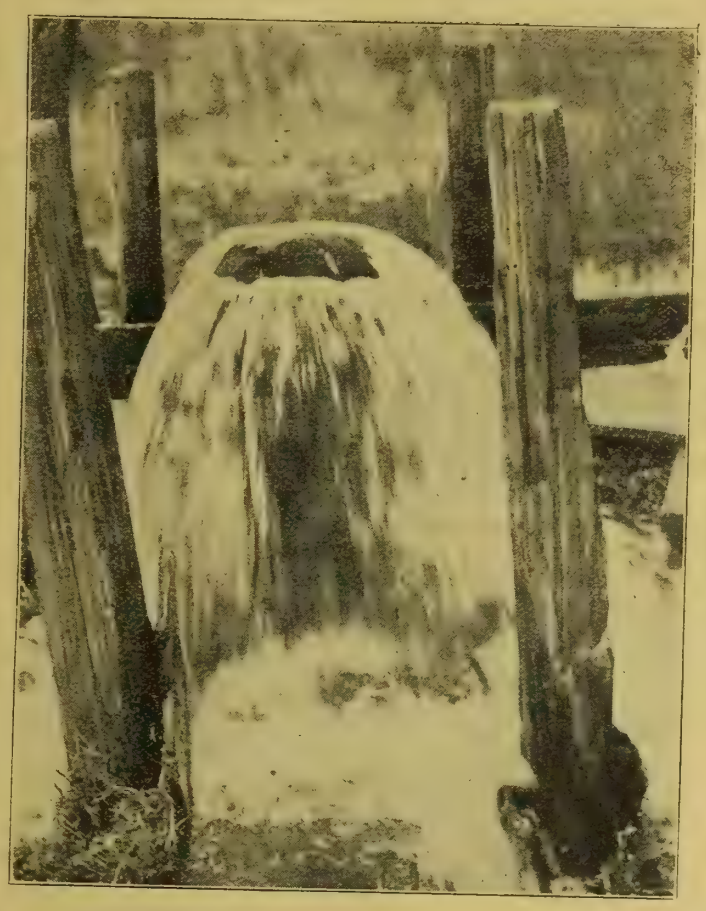
The nitrogen fixing or nitrogen gathering bacteria associated with the growth of leguminous plants find the conditions existing in sandy soils extremely favorable for their development and for the fixation of large amounts of atmospheric nitrogen. The facility with which the air circulates in these soils favors the formation of nodules on the roots of leguminous crops. It is pointed out that the nodule bacteria take considerable quantities of nitrogen or oxygen from the air surrounding the nodules, and as in sandy soils this air is frequently renewed, the best conditions for the growth of the organisms are created. It has been observed that in compact, fine grained soils, where the air does not penetrate so readily to greater depths, the nodules on the roots are all near the surface, whereas in sandy soils they are distributed lower down on the roots of the plants. Another factor strongly favoring the fixation of nitrogen in sandy soils is the comparatively small proportion of available nitrogen present in them.

It is pointed out that leguminous crops new to a particular region may fail to develop nodules because the proper organisms are not present in the soil. In the experiments conducted, soy beans grown on one plat during the first season failed to develop nodules, remained yellow and small, and evidently suffered for lack of nitrogen, while a crop of cow peas on an adjoining plat grew vigorously and was of a dark color. The soy beans had no nodules on their roots, while the cow peas were abundantly provided with them, showing that the bacteria producing nodules in the two crops are not the same and that the soy bean germs are not naturally present in the sandy soils of South Jersey. When some earth was obtained from a field where a vigorous crop of soy beans had been raised and applied to the soils in question, very satisfactory yields of soy beans were as a rule secured.

Lime.

While large amounts of lime are not required for sandy soils, applications of lime are of value in that they encourage the formation of humus substances which help to fix potash and phosphoric acid. As lime encourages the actiivties of various kinds of soil bacteria and thus tends to hasten the process of decay and nitrification, sandy soils should be limed less frequently and smaller dressings should be given than in treating heavy soils. Ground unburned lime is likely to give better results than burned and slaked lime. One-half ton per acre of ground oyster shell lime may show results on sandy soils while remaining entirely without effect on a heavy soil. It was observed that an adequate supply of lime is important in both heavy and light soils in promoting the growth of most leguminous crops, and especially of alfalfa and of various clovers.

Land To Rent



10 in. Well Sec 33. Artesian flow. Exact reproduction of photo.

in artesian belt of Kern County, N. W. of Wasco, either for cash or share of crop with option to purchase if desired at $100.00 per acre. The land is good for alfalfa, cotton, grain, etc. 204 sacks of onions weighing 100 to 105 lbs. to the sack raised on ½ acre.

WATER

is artesian, cheap, pure and unlimited in quantity.

All conditions favorable for making money.

Preference of employment given to renters on Company's Improvement Work. Wanted men to rent at once who have stock and tools for road and ditch work.

This week we begin operations upon the ground by opening a ranch headquarters on Sec. 17. Stock, implements and grading tools have been provided to operate the compahy's experimental farm and to give immediatd employment to renters on ditch work. Some of the best paying crops should be planted in October. Write us and make arrangements to visit the land at once.

To the Water Well Owners and Drillers of Southern California

We beg to introduce ourselves and ask for a chance to prove worthy of your permanent confidence and patronage.

We have found that with some additions, the complete line of oil well supplies which we carry at Los Angeles and in our branch stores, is admirably adapted to supply the needs of the water well trade, and we are entering this field with all the vim and vigor which have built up our immense oil well business in the past five years.

If you are in need of an engine, pumping outfit, casing, belting, tools (small or large), pipe, fittings or supplies of any kind, we will be more than pleased to serve you. You will find our goods of the better grade only, our delivery prompt, and our prices the very lowest, consistent with first quality.

We will take pleasure in supplying any quotations or other information you may desire and will appreciate an opportunity of making your acquaintance.

Ask for our special bulletins on water well supplies. Mailed free.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FILLING THE SILO.

By W. J. Kennedy, of the Iowa Agricultural Experiment Station.

The problem of filling the silo for the first time is going to confront more farmers this year than ever before. Thousands of men are asking these questions: When should the corn be cut? What length should the corn be cut? Should the silo be packed rapidly or slowly? How should the corn be distributed and packed? Should water be added during the filling? How should the cracks or other air spaces be filled? What is the best way to prevent waste on the top of the silo? What does it cost per ton to fill the silo? How soon after filling is the silage fit to use?

In attempting to answer some of these questions the author, in addition to drawing upon his own personal experience of many years with silos, has consulted all of the leading experiment station workers who have had silo experience, and in addition many of the leading beef producers and dairymen. The answers brought out many points of interest. Chief among them was a marked tendency on the part of the beef producers to advocate a more mature corn at filling time than in the case of the dairymen.

Time to Cut Corn for Silo.

While there is some slight difference of opinion on this matter, practically every answer indicated that the corn should be dented, in the dough stage, or when about one-fourth the husks and the lower leaves are turning brown in color. This would indicate that the best results are obtained when the corn is mature enough to cut for shocking purposes. The nearer the corn is to maturity the more food nutrients it contains. Thus the more valuable from a silage standpoint, providing there is enough moisture to insure proper fermentation. Immature corn makes a dark colored, sour silage which may cause animals to scour badly.

Length of Cut to Use.

In the discussion of the lengths in which the corn should be cut when put into the silo, much difference of opinion was manifested. Some advocate one and one-quarter inches, others one inch, others three-quarters inch, many one-half inch, while some advocated less than one-half inch. The longer the cut used the more economical from the standpoint of power and the more rapid the filling of the silo. The shorter cut, such as the half inch length, insures less waste in feeding the silage and makes it possible to put a greater quantity of corn in the silo. Taking everything into consideration, either the half inch or the three-quarter inch cut should be used. This will make a very palatable form of silage for the animal, and also make it easier to pack the silage so as to eliminate the air, thus preventing waste.

Rapid or Slow Filling.

This is a point on which there is much difference of opinion. Where slow filling is practiced it is always possible to pack the silage thoroughly by tramping and allowing it to settle. In this way the full capacity of the silo may be utilized. The objections to this system are that where a large quantity of silage is to be put up on a farm or on several farms with the one filling outfit, it takes so much time that some of the corn must be put in too green at the beginning and some more of it too dry at the finish. It is also more expensive than where rapid filling is practiced.

Where rapid filling is practiced, say from 80 to 100 tons per day, the cost of filling is reduced to the minimum. A large quantity of corn can be put in the silo in a short time, thus insuring a more uniform quality of silage. The chief objection to this method is, unless provision is made for refilling in about a week or ten days time, that after the corn is through settling in the silo it will only be about two-thirds full. This may be partially overcome on a farm where two or more silos are built side by side by filling one for a day, then the other a day, allowing some time for the corn to settle, until the two or more silos are filled. In some instances, where about three days are required for the filling, the work is commenced on Friday and Saturday, allowing the corn to settle over Sunday, and the work is finished on Monday. Where fast filling is practiced the only way to utilize the full capacity of the silo is to fill to the top, let it settle for a week or ten days, remove the waste on the top of the silo, then refill. This requires a resetting of the machinery when used by more than one farmer, but it will pay.

Distributing and Packing Corn.

There are several different ways for distributing and packing the corn in the silo. The principal points to be observed are that the light and heavy portions of the corn should be uniformly distributed. That is, the stalks and ears should not be in the center or at one side and the lighter portions, such as the leaves, at the other side. The corn should be uniformly packed or tramped in all parts of the silo. This is necessary to insure a good quality of silage. The majority of the silo owners prefer having the surface of the silage saucer shaped, about two feet higher at the sides than in the center, for the reason that the center, where the corn drops and the men usually stand, gets solid and hard and does not settle afterward as much as the sides. (This is especially true of those silos filled without some form of a distributing device.) If the sides are constantly kept about two feet higher than the center and well trod or tramped when the silo is full, the silage is wedged tightly against the sides and the heat of fermentation retained, thus killing the germs of mold. One reason why silage molds more at the sides than in the center is that it is not packed closely enough against the sides to prevent the air from reaching the heated silage, thus furnishing mold making conditions.

There are several patented distributing devices on the market. The majority of these are very helpful in filling the silo. A very simple and cheap device may be made by sewing t[o]gether a number of sacks (with t[he]

ends cut out), making a tube. This is attached to the end of the blow pipe and manipulated by a man inside of the silo. In this way the corn can be evenly distributed over the entire surface of the silo. The packing of the corn is an important point. True, in time it will settle of its own accord, but more corn can be put in a silo and much better silage made when the packing is given careful attention. Tramping on the part of the men is helpful. The best way, however, is to use two good reliable men with cement tampers. The best silage the writer has ever seen was in a silo which had been packed by cement tampers. There was not a particle of waste after a few inches on the top had been removed.

Self Milker.

I have a valuable Jersey cow which sucks herself. Is there any remedy? —Subscriber, Visalia.

Medicinal applications, even of the bitterest kind, to the teats, seem to be of no permanent value. A pole extending from a band around the body to the halter may be tried.—F. G. M.

In addition, we give the following from an article by Mrs. Sherman in the Cultivator of October 28, 1909:

"The next thing tried was a corslet of staves around Bossy's neck. These staves were taken from a small barrel and had a short staple driven in near each end on the upper side. The square corners were rounded off and then a heavy malleable iron wire was passed through the staples. The whole affair was carefully fitted, and then the staples were driven home on the wire and carefully clinched on the under side. The ends of the wire were turned into rings, and a hame strap used to buckle the affair around the neck. This worked on all except one cow, and she learned to get half over on her back and twist over so that she could get to half her udder. She caught herself when down one day and nearly died before released. A self milking cow is nearly always on one's mind. You wonder how she is each morning, whether dead or alive. The common device of putting a seatless chair over the cow's head I notice on a cow between here and town, but modern chairs are not put together with strength enough to make this arrangement lasting. This same cow had another cow put in the corral with her, and she was nursing her the other day. Evidently she is a milk lover.

"The foreigners here split the cow's tongue to prevent self milking. This is good in that it stops the habit, but it is bad because in many instances the cow loses the power of rolling over the cud. I have seen an arrangement of two sticks with a surcingle. The two sticks came up on each side of the cow's shoulders and were fastened to the cheek straps of the halter. The other ends of the sticks were secured to a surcingle around the cow's body. These work well enough in most cases and are a modification of the usual plan. The standard form seems to be the halter on the head with the surcingle around the body, with the broomstick swinging between the front legs. The end of the stick at the halter is given enough swing on a short strap not to bind on the breast. In some cases it is necessary to give as much play at the other end. This, however, must be regulated by the individual to fit the cow. None of these devices are perfect, none of them will overcome the difficulty absolutely. There are some cows that will find a way to get the milk, no matter what happens. The way out of the trouble is not to keep the cow, but send her to the butcher as quickly as possible. I know where there is only one cow and she is bought cheap because of this vice, people will keep her. They should, however, be willing to let the cow beat them sometimes, if it is all considered in a day's work. The trouble is that we Americans do not take the foreigner's view of things. An old Swede living down the road a little piece has a self milking cow. He was standing looking at her, and said to me: 'She is mean to take her milk. I am mean to put that ring with nails in it around her nose and that stick between her legs. Two mean things together, each trying to beat the other. Well, we will not worry about it, for when she gets meaner than I am I can have her head cut off and still get thirty dollars out of her.' I thought he was right. Why worry when he was master at least of the cow's fate?"

Sugar-Beet-Pulp takes the place of green grass and is the best butter producer in the world. 50 cents per ton at Los Alamitos Sugar Factory.

Cough.

The past six months my cow has been troubled with a hard cough. There is no discharge from the nose, and the cow otherwise is in good general condition, giving a full flow of milk, and improving in flesh. Should we use the milk?—Subscriber, Gridley.

Considering the fact that the cow has remained apparently well while the cough has persisted six months justifies a belief in a benign cause. However, this does not occlude all possibility of a disease of an infectious nature. Tuberculosis, if suspected, may be eliminated by the tuberculin test. I would not discard the milk because of a cough alarm.—F. G. M.

Constipation.

My young sow is ailing. She was fed freely upon small white potatoes, but, refusing this, I changed to corn, and now she eats and drinks very little. Observing constipation, I resorted to warm water injections, which brought away some hard mucous covered feces. From the beginning she seemed weak in her hind legs.—Subscriber, Orange.

Provide comfortable quarters where the pig can have shade during the day and be protected from the cold at night. Feed sparingly upon select kitchen slops, surplus milk or ground foods. Give two large tablespoonfuls of Epsom salts as a laxative, but continue the injections if necessary. Mix powdered wood charcoal, Glauber salts, hyposulphide of soda, table salt and sulphur, equal parts, and give a large teaspoonful once a day to a hog of 100 pounds weight. In case other pigs are similarly afflicted, report to this department for further advice.—F. G. M.

Wart.

A young mare has something like a wart on her left flank. However, it seems rather soft for a wart, and, at times, blood oozes from it.—Subscriber, Ione.

Rub powdered bichloride of mercury into the raw surface of the tumor every four days. When certain all diseased tissue has been removed, discontinue treatment and allow the wound to heal.—F. G. M.

Sore Mouth.

A cow four months old has fever sores in her mouth. She cannot eat solid food, dry or green, but does eat bran. There was rapid loss of flesh the first three days of the sickness. Also three young heifers, in the best of condition, became stiff in their legs the same night. Their feet seem to be sore, eyes red, and not able to eat well.—Subscriber, Ione.

The rapid loss of flesh in the cow, followed by ulcers in the mouth, indicates a febrile disease, and in all probability the same ailment is apearing in the younger cattle, but involving the feet first. Some infecting agent is evident, possibly the microbe of mycotic stomatitis. Avoid coarse feeding stuffs and hays containing beards. If the feet become sore, keep the patient out of pastures to prevent the brush and grass from irritating the sores. Use a one per cent solution of permanganate of potash, applied daily with a swab to the ulcers in the mouth and upon the feet. Mycotic stomatitis runs its course in about two weeks, usually ending in recovery.—F. G. M.

Get at the Bottom of the Pumping Question

Of all the questions that the farmers must investigate, the the most important is that of proper pumping equipment.

His pump must run with little attention, and frequently running for weeks without stopping. It takes a pump that has wearing qualities to stand up under such a test.

DOW
Centrifugal Pumps

—both vertical and horizontal—meet all these conditions with some to spare.

The design is correct in all features. No complicated balancing and leakage devices are used, thus eliminating trouble from cutting by sand.

The capacity does not fall off after years of use, neither does the power required increase.

The first cost is no higher than with inferior makes, and the cost of running is lower than any other pump on the market.

Your investigation will confirm these statements of fact. Call or address either office.

General Agriculture

INTERNATIONAL CONGRESS OF PLANT BREEDERS.

By G. P. Rixford.

The fifth international conference of plant breeders will be held in Paris from September 18th to 23rd. California is preeminently a horticultural state and is vitally interested in everything that makes for progress in every department of the great field of agriculture and ought to be represented at this important meeting. It is said that there are a thousand men and women plant breeders in America, and those in California actively engaged in creating new plants are numbered by scores at least, the most eminent of whom is Luther Burbank. A congress of these scientific horticulturists in this country would be a crowning epoch in agricultural development.

The official title of the congress is tne "Quatrieme Conference Internationale de Genetique." Phillippe L. de Vilmorin, 66 Rue Boissiere, is the secretary and is much interested in making this meeting a success. He is a distinguished plant breeder himself and is giving much attention to the subject at the magnificent properties of the Vilmorin-Andrieux et Cie. at Verriers. The membership fee for those who wish to attend the meeting and go on the excursions is 25 francs and for those who do not expect to attend the meetings, 15 francs, which will entitle them to receive the printed proceedings, which will contain articles in English, French and German on matters of much interest to plant breeders.

It is hoped that California horticulturists will give their support to this very important meeting, either by attending in person or at least by sending their names and membership fee to the secretary and by lending their influence to secure the seventh session of the congress for San Francisco in 1915. The attention of the officers of the Panama-Pacific International Exposition has already been called to the importance of securing the conference for this city during the great fair. They will give it their enthusiastic support and President Moore will send an invitation to the congress inviting it to meet here in 1915. It is understood that the next meeting has been promised to some European country, but the second meeting is still open and it is thought that the chances are good, if energetic efforts are made to secure the meeting for San Francisco.

If any Californian has a horticultural friend in Europe, let him be urged to attend the conference and make every effort to draw the seventh meeting to this city. It is hoped that Mr. Walter T. Swingle, chief of the office of crop physiology and breeding investigations of the U. S. department of agriculture, may attend the meeting in Paris and carry the invitation from President Moore, and if he is unable to do so, Raphael Weill, now in Paris, will be asked to attend. It is of course too late for the plant breeders of the state to act as a body, but they can individually use their influence to draw the meeting in this direction. Let all who take an interest in the proposed conference send their addresses to the undersigned, who will record them in order that they may be kept advised on matters of interest in this connection and be called together to effect an organization if found necessary or advisable.—G. P. Rixford, 1813 Pierce Street, San Francisco.

FOREIGN CROPS.

The department of agriculture issues the following statement respecting foreign crop prospects about August 1:

Cereal harvest was in progress during July over a great part of the northern hemisphere and, excepting in one or two important producing countries, the results do not seem to be varying materially from earlier anticipations. In western Canada spring wheat prospects appear to have maintained their excellent promise in Saskatchewan and Alberta, but black rust is recently reported, though not officially confirmed, in Manitoba. The condition of spring wheat at the end of July was put at 90 for the whole of Canada against 77 last year, the range in the three western provinces being from 90 to 96 this season as compared with one of from 56 to 68 a year ago. The total yield of winter wheat is estimated by the Dominion department of agriculture at 17,706,000 bushels compared with 16,610,000 in 1910. The largest crop of wheat ever grown in the three western provinces was 147 million bushels in 1909; almost 2¾ million acres have since been added to their wheat area, and until recently a round 200 million bushels was the favorite trade estimate for the present year.

Cereal harvest in Europe had at the beginning of August reached the latitudes of the British Isles. In the West it was from one to three weeks early, in the center about normal, and in the East from two to three weeks late. From the present somewhat vague indications the total European wheat crop is not likely to equal that of last year.

In western Europe as a whole the prospects are for average, or possibly better than average yields; in the United Kingdom and France quantitative estimates are not yet available, but the trend of popular opinion is toward confidence in about an average outturn of wheat of excellent quality, with crops of rye, and especially oats quantitatively not quite up to that standard. Spain and Italy have each announced banner crops of wheat; the former reports 157 million bushels against 137 million in 1910 and a former record yield of 144 million bushels in 1909; the latter estimates the current crop at 197 million bushels against 153 million a year ago and 190 million in 1909.

In central Europe cereal yields, owing to favorable weather, will probably be better than at one time anticipated. In Belgium wheat promises better than last year. In Germany and Austria, however, neither wheat nor rye promise quite so well as in 1910, and in the first-named country the outlook for oats is very discouraging; wheat in Hungary has greatly improved and promises to surpass the 169 million bushel crop of last year; the barley and oats crops are also officially rated as quantitatively superior to a year ago, but rye is this season deficient. Unofficial estimates of the Roumanian wheat crop make it smaller than in 1910 but above the average, while prospects in the other Balkan states seem generally favorable.

The agricultural situation in Russia seems during August to have been greatly modified. Prolonged drought in western Siberia and in the eastern

Distillate Engine

Mounted on wood skids, complete with 8 x 6 Pulley, Batteries, Spark Coil, Fuel Tank, Lubricators, Muffler, Wire and Switch.

The Patented Galvanized Hopper for cooling is made of one piece of sheet iron, heavily galvanized all over after completion. The circulation is perfect and evaporation slight, making an ideal cooling device.

They are built in two sizes and both rated well below the power they will develop.

provinces of European Russia, including the important spring wheat producers, Samara and Orenburg, is reported to have resulted in great losses. The two provinces combined ordinarily produce about 120 million bushels. No quantitative official expression of the results of the calamity have yet appeared but it may be of interest to note that trade estimates of the total Russian crop are being reduced 150 million to 200 million bushels. The actual extent of the damage, however, must necessarily be in doubt until the issuance of the official figures.

In Argentina and Chili, where autumn-sown crops are now passing through the mild winters of those latitudes, weather conditions have been reported favorable, and hopes, based on the present appearance of the fields, are for good yields four months hence of wheat, oats and flaxseed.

The progress of the monsoon in British India has not been satisfactory but has lately improved. Much anxiety has been expressed respecting the seeding of crops, but it is believed that good rains would yet save the situation. The crops jeopardized are those harvested in autumn, commonly known as the food-grain crops. Wheat and flaxseed are sown between September and December, but a failure of food grains would likely have an indirect influence on the export of wheat.

PLANTING AHUACATE SEEDS.

By Dr. F. Franceschi, Santa Barbara.

Plant them as soon as received. They will retain their vitality only for a short time.

Redwood sawdust mixed with one-fourth clean sand will make the best rooting material. If this is not available, sifted leaf mold with sand will do, or any other material which will be porous and will allow free expansion of the roots. Manure should be avoided; it may cause decay of the young roots.

Boxes about six inches deep should be used; if too deep, more difficulty will be found in transplanting.

In whatever season the seeds are planted, it should be done under some shelter; either under glass, under cloth, or in the house; in order to insure an even temperature and a more uniform degree of moisture.

Seeds should be planted one inch apart, with their pointed end standing a little above the ground. Boxes must be kept moist, but they must have good drainage.

Within three to five weeks germination will take place, the roots plunging downwards from the base of the seed, while the two sections of same will be split open by the fast growing plantlet. Sometimes two or more sprouts will emerge from one seed; only the strongest should be left, except when found that each one has developed an independent system of roots.

When the seedlings will have developed four to six leaves, it will be the right time to transplant them, before the roots grow too long and too much crowded in the boxes. This can be done either in pots, boxes or cans, always employing good garden soil.

Three to four months after having been potted, the seedlings should have grown strong enough for transplanting in the open ground, where they are sure to grow well under ordinary care. When about one year old they will be ready for budding or grafting.

The Citrus Fruit Association at Fillmore, Ventura County, will build a new lemon packing house.

PARCELS POST DOINGS IN SOUTH AMERICA.

By Edward Berwick, President Postal Progress League of California.

Delegates representing the governments of the Argentine Republic, Bolivia, Brazil, Colombia, Chili, Ecuador, Paraguay, Peru, Uruguay and Venezuela, foregathered early this year in Montevideo, and founded the South American Postal Union. Among other measures they established a parcels post for parcels up to 22 pounds (10 kilogrammes), size not to exceed 216 cubic decimeters for land transport, or 50 for sea transport.

The charge for parcels up to 2 1-5 pounds (1 kilogramme) is made up of as many times 5 cents (25 centimes) as there are administrations participating in the land conveyance, with, if need be, half the sea charges fixed by paragraph 2 of article 3 of the convention of Rome; but the charge due to any administration whose services take part in the sea transport may, however, in no case exceed 10 cents for parcels of 2 1-5 pounds, irrespective of distance. This may be raised to 15 cents for parcels up to 11 pounds and 20 cents for those up to 22 pounds weight. So that a parcel of 22 pounds can travel over the wide area of Brazil to any part of Argentina for 40 cents. This is almost the whole length of South America.

And citizens of the United States still are paying 64 cents for sending parcels of four pounds to the nearest village!

Surely what the Latin races of South America can do is within the bounds of possibility of achievement for the composite cosmopolitan races of the United States!

If not, why not?

FLAX WILT.

Flax wilt is caused by a mold-like fungus. The fungus threads attack the young seedling, and may either kill it outright or merely stunt its growth. The fungus may live for a number of years in the soil, on old flax straw, or on other decomposing material. It is for this reason that flax should not be grown on the same land more than once every five to seven years. The disease may also be carried on the seed. The reproductive bodies (spores) are scattered over the seed at harvest time, and remain there during the winter. In the spring, even though the flax be sown on unaffected land, the spores on the seed will germinate and infect the flax plants. There may be then two sources of infection, viz., the soil and the seed. Danger of infection from the first rotation, and from the second, by seed treatment.

Seed flax should first be very thoroughly fanned, in order to get rid of all light seeds, chaff, pieces of straw, etc. Then it should be spread out on a floor or canvas, which has been previously well washed with boiling water or strong formalin solution. Spray the seed with formalin, used at the rate of 1 pound to 40 gallons of water. It is necessary to use a compressed air sprayer, which will throw a fine, misty spray. While one man rakes or shovels the grain over, another should apply the spray, being sure to moisten every seed, without using too much of the liquid. The flax should then be covered for a couple of hours with sacking or canvas previously cleaned. It should be shoveled over, and may then be sown.

If the seed is carefully treated, and sown on land which has not grown flax for 5 to 7 years, there should be no wilt. It is important to remember that untreated seed, grown on clean land, may produce a wilt-affected crop; and, in the same way, treated seed sown on unclean land may produce a diseased crop. Therefore, great care should always be taken to get clean seed and sow it on clean land.—E. C. Stakman, Minnesota University Farm.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

THE GRAVENSTEIN.

One of the best of early fall apples, and some say the very finest apple grown, is the Gravenstein. It is an old time favorite, of German origin, yet not widely known, because it is a very exacting apple, and will not smile, rather it will not take on its most becoming blush, excepting under most favorable circumstances. There is one section of this state in which the conditions all seem to be met, and a perfect apple is the result.

It is often remarked that Californa may grow oranges, or prunes, or raissins, or flowers, superior to any section in the world, but she can't produce apples with the East. Now we wish to go on record. No section of the East, nor of the world, ever produced an apple superior to the best of Sonoma County's Gravensteins or Pajaro Valley's Bellflowers, or the Delicious, the Spitzenberg, or others adapted to the conditions of some favored sections of the foothills of the Sierra Nevada.

The Gravenstein has been proved out for more than a hundred years in this state and has made good. There were apples at the Sebastopol show last week which were grown on a tree said to have been planted more than one hundred years ago by the Russians who colonized a section along the Russian River in Sonoma County. This long test, together with satisfactory returns, should impel those who have similar conditions to plant the Gravenstein. It's one of the earliest apples in the market—the earliest of the highest quality — and a good keeper.

But the main point is, adapt your productions to your conditions. Burbank says the Gravenstein will not grow to perfection in the hot interior valleys. Neither will the date, the raisin, the early cantaloupe, grow to perfection under coast influences. Excepting for experimental purposes, planters should use greatest care in selection of crops which require years before their success or failure may be learned.

But regarding the Gravenstein, and the great show of last week at Sebastopol, more will be given in editorial correspondence in a later Cultivator.

On another page of this issue we print official list of apple awards.

WILEY AND PURE FOOD.

Apparently Dr. Wiley and his superior, Secretary Wilson, are endeavoring to get the strangle hold on each other. The situation is becoming so strenuous that Secretary Wilson has threatened to resign. Wiley's inclination does not seem to tend in that direction. So far as can be judged by the tone of the press the c untry over, Wiley has the greater part of the people behind him in the feeling that he stands between the consumer and the meat and other trusts which would feed the people on "vitrified beef" and things.

Californians as a rule have no particular love for Dr. Wiley, because of his bullheadedness in the sulphured fruit ruling. This trait of Wiley's of not listening to reason, but forcing his way through without regard to rhyme or reason, will ultimately lead to his removal, but so far it is undeniable that he has the support of a vast number. This support will be strengthened by the aparent combination of the trusts on the merest technicality to oust him from office. That was a serious mistake, and a more reasonable charge should have been trumped up.

We maintain that a fairly good indication of the Eastern estimate of Dr. Wiley is given by Walt Mason:

"You can't speak too highly of good old Doc Wiley, the government chemist, our bulwark and hope, protecting our bellies from ketchups and jellies and all sorts of things which are loaded with dope. He's death to the faker; he chases the maker of fraudulent remedies, labeled with lies; he seizes the butter too rancid to utter, and puts the kibosh on the poisonous pies."

An Eastern exchange, the Journal of Agriculture, gives the following as its estimate of Dr. Wiley's work:

"Dr. Wiley has been a somewhat fussy person in office. He must have impressed many people with being overofficious. He has seemed at times to court the limelight more than the laboratory. He has rushed into places where angels fear to tread, and has in this way somewhat shaken public confidence in his personal judgment, if not in his professional and official capacity. After all of this is noted, however, it remains to be said that there is nothing more deceptive than mere superficial appearance of things. Men as fantastic and bizarre as Dr. Wiley are often found to be masters of their calling, and moved by an earnest desire for the doing of good. This may be true of Dr. Wiley. But even this should not save him if he can be shown to have grown bumptious to the extent of assuming that he is above the law and above the people whose interests as taxpayers the law was made to serve."

THE APPLE.

North America is the leading apple producing section of the world. The United States and Canada produce an average of about 100,000,000 barrels annually. The greatest and most profitable apple region of this country, considering productiveness, quality, long keeping of fruit and longevity of tree, is that which begins with Nova Scotia and extends to the southern end of Lake Michigan. Other important regions include small sections of Virginia, portions of the Ozark Mountains, the adjacent Arkansas section, the foothills and coast valleys of California, and northward to the valleys of Oregon and Washington. The apple grows and does well in all parts of the United States north of Florida and immediate Gulf borders.

The apple was introduced into this country very early, when it was prized chiefly for its cider, and the common notion as to a cider producer was that "anything would answer." This perhaps accounts for its common neglect. In nearly all the Eastern apple producing sections the apple orchard is merely an annex to the other features of the farm. If the tree lives, good; if not, no harm has been done. More lately intensive culture has been given, and the apple is being restored to its proper place. California apple producing possibilities have never been fully appreciated. It is common, even with older residents, to refer to the lusciousness of our peach apricot, grape and orange, and to end up with the expression, "California cannot produce the apples of the East," but with fullest understanding of apple requirements, and by planting those varieties which will do well in the particular section chosen, the apple will come to its own, and all will ultimately realize, as a few do now, that California's apple growing future has great promise.

The Iowa state college has started short courses in hog specials, corn specials, and other subjects in addition to the usual classes conducted along general stock lines, poultry, etc. Soils, cookery, sewing, sanitation, decoration, and many other subjects come in for special attention. Connected with it, as with the California courses, is a rural life conference.

IMPORTS INCREASED.

The importer would be glad to show a decrease in quantity of lemons imported under the cent and a half duty per pound, but unfortunately for him he is unable to make any such showing. As a matter of fact importations of lemons increased about 25,000,000 pounds during the year immediately following the passage of the Payne-Aldrich act over importations of the year preceding. To give more explicit information, we may say that the receipt of foreign lemons at the port of New York in June 1909 was 238,500 boxes; in June 1910, 307,000 boxes; June 1911, 359,000 boxes; July 1 to 28, 1910, 265,920 boxes; between same dates this year, 387,525 boxes.

Here then the importer must fall back upon the other claim that "the widows, orphans and poverty stricken" have been compelled to pay an excessive price for lemons. But Mr. Powell's investigations in Europe have developed the fact that the European in free trade countries is paying practically the same as the American consumer. There is such an amount of juggling with the markets that a certain profit has to be secured for all hands. Under the cent and a half tariff California methods of co-operative marketing have put the fruit into the hands of the consumer at prices which have been entirely satisfactory to him, but of course the "widows and orphans" argument sounds good to the importer, and he is using it to the limit.

CALIFORNIA AS A LEMON PRODUCER.

The last two years has witnessed the planting of 3,380 acres of lemons in California. These plantings are distributed approximately as follows: Los Angeles County, 1,200 acres; Ventura County, 1,000 acres; Riverside County, 500 acres; Orange County, 250 acres; Tulare County, 200 acres; San Diego, 100 acres; Santa Barbara County, 30 acres; total, 2,180 acres.

Plantings estimated for next year, providing there is no serious disturbance of the tariff, comprise 5,150 acres. It is also estimated, in addition to these plantings and the bearing orchards, that there are 56,000 acres capable of producing lemons. Yet the importer is saying: "What is the use of protecting an industry which has no possibility of ever supplying the needs of this country?" Granted a fighting chance, California can supply all the lemons needed on this continent.

Secure the full amount of humus from manure or green crops plowed under by keeping beneath the surface. Manure thrown on the top of the soil and allowed to dry there and be cultivated about these hot days loses in dry oxidation and does not form humus. If it is under the soil in contact with moisture, more beneficial results are obtained. While soils in California are poorer in humus than those of the humid East, the humus, on the other hand, is much richer in nitrogen.

Southerners refer to cotton growing as "making" cotton. An acre will "make" so much, and it requires "15 acres to the mule." Of all the cotton produced in the world America furnishes four-fifths. India, Egypt and Africa are all factors, but small ones, and the demand for cotton increases every year. Prices for the past decade are much higher than any preceding ten years. The South will "make" this year about 31,004,000 acres.

Agricultural News Notes of the Pacific Coast

Northern California

Many new wells are being put in in Tehama County.

Mendocino County claims a future as a peach grower.

A big potato crop is being loaded onto the Sacramento River steamers.

Lassen County claims this year a hay crop of exceptional quality and large yield.

The University Farm at Davis has added some pure bred cattle and hogs to its stock farm.

The price of hops has soared above the 40 cent mark and shows no indication yet of coming down.

A successor to the Sutter Produce Company will take care of packing and shipping Yuba City's grapes.

Horticultural Commissioner Mills of Butte County reports that the olive knot has been practically eliminated.

Tehama County is producing extensively of tomatoes. Some growers are reported to have netted $700 from a single acre.

Fruit shipping at Winters, Yolo County, has slacked off and there will be little doing until the grape shipments start.

The new alfalfa meal mill at Gerber, Tehama County, is producing 1,200 sacks of meal a day.

Beet fields about Woodland, Yolo County, are shipping ninety tons of beets daily to the factory at Hamilton.

Omaha capitalists have organized a $20,000 company for the purpose of engaging in fig culture in Butte County.

Oswald, Sutter County, is sending out carload shipments of Thompson Seedless Grapes to Washington and Oregon.

Williams, Colusa County, expects to become in the next few years one of the leading poultry raising centers in the northern end of the state.

Japanese who have been leasing some of the best orchards in Placer County are organizing a Japanese Protective Union, and will build packing houses for the handling of their own fruit.

The plans for Butte County Drainage District No. 1, 6,000 acres between Gridley and Feather River, are now practically complete. The cost of the system is estimated at from $35,000 to $40,000.

There are 400 people employed in the orchards of Butte County in gathering and packing deciduous fruits. Every box of fruit leaving Chico carries beside the name of the shipper the name of the town from which it is sent.

Hop picking will begin in Sonoma County next week. Hop picking machines will be used on many of the ranches. One of these machines picks between 40,000 and 50,000 pounds a day, at a saving of from 50 to 65 cents per hundred pounds over hand labor.

A ton of Hawaiian fruit seeking entrance to San Francisco was found infested with the Mediterranean fruit fly by Quarantine Officer Bremner and the entire consignment was dumped into the bay after being boiled an hour to insure the death of any of the pests.

Central California

Laton, Fresno County, ships out six tons of butter every week.

Inexhaustible wells have been tested this season at Fort Romie, Monterey County.

Barley growers of the San Joaquin are making big money on this season's crop.

Prizes aggregating $2,500 will be awarded this year at the Watsonville apple annual.

This August is reported to be the coolest that the San Joaquin Valley has experienced in five years.

The State Creamery Operators Association will hold a week's session in San Luis Obispo in November.

Morocojo and Moss Landing in Monterey County are busy with threshing work and show a big yield of barley.

The Commercial Association at Kerman, Fresno County, is urging strenuous action for eradication of Johnson grass.

H. A. Sessions, of Vinland, has been appointed Director of Farmers Institutes in the San Joaquin Valley.

Aromas, San Benito County, has shipped since May 6 nearly 100 carloads of berries. The season will be extended over another month.

The Pajaro Valley Poultry Association is making enthusiastic plans for its state poultry show to be held during apple annual week, October 11-14.

The Santa Clara County Grape Growers Association held a meeting last week which was addressed by Secretary Stoll of the State Association.

Raisin grape growers are earnestly hoping for a few weeks of good hot weather to hasten ripening, so that harvest may not be delayed until danger of early rains.

Work has begun on the Stanislaus River dam, which when completed will supply water to more than 70,000 acres of land in the southeastern part of San Joaquin County.

Bee men of Kings County are complaining that the honey output will be short because of cool weather. About twenty cars of honey were shipped last year from Kings County.

Another Fruit Growers organization is being perfected at Kerman, Fresno County. The President of the new organization is D. I. Englund; the Secretary is Axel Kap and Manager B. A. Larsen.

Horticultural Commissioner Volck of Santa Cruz County calls attention in his monthly report to the large amount of first class orchard land yet undeveloped in the mountain sections of Santa Cruz County.

The State Board of Fish and Game Commissioners is promoting the formation of a protective fish and game association in each county of the state, so as to bring its work in closer touch with the actual needs and desires of the people.

The directors of the Watsonville apple annual wish it to be known that the coming show is to be called the California Apple Show. They wish it understood that it is not a local show, but for the exploitation of all sections of California which grow aples of good quality.

Southern California

San Diego's newest industry is the raising of French snails.

A total acreage of 5,000 acres of beans is ready for harvest on the great Santa Margarita Ranch.

Antelope Valley cattle growers are shipping their stock to the sugar beet fields to fatten on the tops.

Santa Barbara County livestock inspector reports that county entirely free from Texas fever ticks.

Walnut gathering will begin about two weeks earlier than last year is the report from Ventura County.

The San Diego County Fair will be held at Escondido Sept. 6-9. Grape Day celebration falls upon the 9th.

One grower at Camarillo, Ventura County, has sixty tons of dried cots on hand, for which he has refused 14½ cents.

Riversiders hear with sincere regret of the resignation of Tree Warden Reed, who has given the city miles of well shaded streets.

Cutting of black eyes, Limas and pinks is beginning in Ventura County. The crop of black eyes alone is estimated at 75,000 bags.

The exhibit committee of Grape Day celebration at Escondido on Sept. 9 offers $125 in prizes for best displays of fruit and vegetables.

Twenty-three concerns in Southern California are to be prosecuted for violation of the pure food law by direction of the State Board of Health.

Cotton growers of Calexico are looking to the Mexican laborers now at work in the beet fields of Southern California for their extra cotton pickers.

Ventura County's grain crop has all been harvested. The average production has been exceptionally good this year, some places growing 27 sacks per acre.

Residents of Sierra Madre, Los Angeles County, held a meeting last week to decide upon the best plan for cleaning up the pepper trees along its streets.

The supervisors of Los Angeles County have inspected the territory it is proposed to incorporate into a storm water district to control the floods of the San Gabriel.

Escondido, San Diego County, has not claimed to be a great citrus fruit producing section, but this year has sent out 90 cars of oranges which did not include Valencias now going forward.

The Calexico Farmers and Merchants Club is actively promoting the interests of town and country, good roads, cultivation of sugar beets, sugar cane, building operations, water systems.

The nursery which the Forestry Department has maintained in Lytle Creek Canyon will be able to meet the demand for forest trees to be planted on the great burned over area in the San Bernardino Mountains.

Active work is to be commenced about Sept. 1 on the damming of the Colorado about forty miles north of Needles as a part of the great irrigation project which will water over 300,000 acres of land in Chucawalla Valley and Palo Verde Mesa.

The Coast

Toppenish, Washington, is shipping out thirty-five carloads of hay per day.

Offers of 45 cents a pound for hops have been turned down by Oregon growers.

A bee farm in active operation will be one of the features at the second annual Clark County Show.

So little rain has fallen on the ranges in Southern Arizona that stockmen are much discouraged over prospects.

Wenatchee, Washington, is shipping out carloads of green deciduous fruit. Peaches so far form the bulk of the shipment.

The bean crop near Yuma, Arizona, is averaging about a thousand pounds to the acre, much lighter than preceding years.

Thousands of conifers and eucalypts are being set out on experimental plots in forest reserves of the Hawaiian Islands.

Two parties of government surveyors are at work in Washoe County, Nevada, preliminary to future irrigation development.

The sugar beet output of Union and Waliowa Counties in Oregon is estimated to run from 15,000 to 20,000 tons this season. Slicing will begin late in September.

The Cohasset Fruit Growers Union has decided to hold a fruit and vegetable fair early in October, at which will be exhibited specimens of orchard and garden products.

Poultry raisers of Klamath Falls, Oregon, are interested in the formation of a county association which will bring the poultry raisers together the latter part of September.

Superintendent Ehrhorn of the Division of Entomology, stationed at Honolulu, H. I., announces thorough inter-island inspection between Oahu and the other islands of the group.

Fallon, Nevada, is making great preparation for its county fair to be held next month. A long list of prizes has already been announced for best exhibits of vegetables, fruit and blooded stock.

The small boys of Springfield, Oregon, are expecting to make pocket money during the first of September by stripping cones from the fir trees, to be used by the forestry department in seeding.

The fruit growers unions of White Salmon and Underwood, Washington, are planning to consolidate, and it is hoped this may be the first step toward a general union of growers over a large district.

Residents of the Lewiston-Clarkston Valley will have the opportunity of attending a fruit school in Clarkston, Washington, for the purpose of studying horticultural conditions in their own orchards. The school opens in January.

C. S. Sterrett, a marketing expert from Los Angeles, has been making a tour of the Hawaiian Islands in company with Dr. E. B. Wilcox, Director of the Hawaiian Experiment Station. It is hoped that his findings will yield a valuable body of information and advice for the use of the island producers.

Animal Matter a Necessity For Poultry

Experiments at various State Experiment Stations have demonstrated beyond a doubt that Protein derived from an animal source is far superior, as an egg producer and flesh builder, to Protein derived from a vegetable source.

Our High Protein "Special" Beef Scraps Will Supply That Necessity

If your dealer cannot supply you, write us, and we will send you samples and price.

Made in California from fresh Packing House Products. Look for the word "Special" in red ink on every sack.

Western Meat Co., San Francisco, Cal.

Dried Milk for Fowls

Nothing better, especially in hot season; nearly 50% protein. Special prices for short time only:

Harding's, $3.50
Casein Co.'s, $3.50
Bent's, $3.75

5 Sacks 15c and 10 sacks 25c less

WEST COAST SEED HOUSE

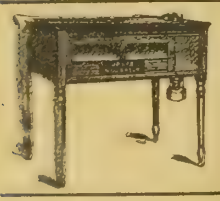
111, 113, 115 WINSTON ST. between 4th and 5th near Main. LOS ANGELES

Catalogs of Everything for Poultry and the Garden

BUY LAYING HENS NOW

PRICES ARE LOWER RIGHT NOW THAN AT ANY OTHER time of the year. If you need hens take our advice and buy them right now. We can supply fine young White Leghorn yearling hens at $8.50 and $9 per dozen. No matter how many you wish, we can supply them at this price right now. These prices are good this month only. In July and August hens are worth more. In September these same hens will be selling at $12 and $15 per dozen. Buy them now and make a big saving. Send today for catalog of prices on baby chicks of all kinds, hens and pullets, etc.

THE PIONEER HATCHERY CO.
112 East 8th Street, Los Angeles



Don't Make a Mistake Remember

There is but one **JUBILEE.** Our customers tell us that there is but one Incubator and that is the **"JUBILEE."**
Let us send you our Catalog. It's free.

JUBILEE INCUBATOR CO., Sunnyvale, Santa Clara Co., Cal

Save Money By Buying This Good Second-Hand Pipe

We can supply you with any size and quantity of Standard Pipe or Casing—all new threads and couplings—all stock guaranteed first-class.
If thinking of buying any kind of pipe, your best interests will be served by writing us for prices and particulars.
PACIFIC PIPE CO., Main and Howard Streets, SAN FRANCISCO.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

CALIFORNIA IDEAL FOR POULTRY.

By Mrs. A. Basley.

Nature, our great instructor, gives plenty of green food at breeding time, shade of trees, animal food, and clear spring water, and if you can duplicate these conditions, which is easily done in this ideal climate, you can hatch chickens in the summer months as well as in the winter, and with less trouble to yourself.

Those that complain that eggs are growing smaller are right. They always grow smaller in the summer everywhere, because the hens are taking on fat preparing for the winter cold and their rest, but here we have no cold and almost no winter, and if the hens are properly fed there is no reason why the eggs should grow smaller or the hens stop laying except for the moult. Eggs grow smaller when the hens have not sufficient succulent green food and not enough animal food or too carbonaceous a diet, that is, too much starch, which is both fattening to the hen and weakening to the embryo.

Show Birds.

The best time to hatch pullets for exhibition is from five to six months prior to the show, according to the breed you are handling. A pullet is at her best just before she lays her first egg. She is then considered to be in prime condition of shape, feather and weight.

My pullets, being bred to lay, commenced laying too early to be in the best condition for the winter shows unless hatched in June or July, or even in August, so I always took pains to have prize winners hatched then, otherwise I had to keep moving them to stop their laying, as well as feeding to prevent it. I know by experience what grand pullets can be hatched in the summer months.

A male bird is called a cockerel until he is a year old, and he is usually in the best condition at nine or ten years of age. At least this is the case in breeds which have a weight clause to the judging. In the smaller breeds they can be younger, and with bantams those hatched late are considered by far the best both in this climate and in the East. Cockerels should not be allowed to mate until a few days before the show. They and the pullets are both in better condition if kept in celibacy.

Hatching in Summer.

Now a word about hatching in summer. It can be done, and done most advantageously, as I have proved by my own experience. The parent birds, however, must be kept in good, vigorous condition, especially the male. Keep the birds free from lice, give them plenty of green food as well as a generous supply of animal food, keep the scratching pen full of good litter, straw, hay, etc., and feed all the grain in that, so they will have to work vigorously for it. This keeps the egg organs and the digestive organs invigorated, and you may be sure of fertile eggs and sturdy chicks.

The reason some people advocate not hatching after May is either because they are getting tired of it, weary of caring for the chickens, it has grown to be an old story and they want a change, or because their market does not warrant it.

Starting a Chicken Ranch.

This brings me to the question, when is the best time to get a chicken ranch? Undoubtedly the summer is the best time to buy a ranch to start in the poultry business. Then houses can be built, yards laid out and everything prepared to commence early in the fall to hatch. In the summer there are good bargains to be had in fowls from breeders who want to sell off their surplus stock in order to make room for their growing pullets and cockerels. The summer is the time when you can make the best beginning, whether you are a novice or an old hand at the business. Another reason for buying soon is that the price of land is advancing rapidly and it is well worth while to take advantage of the lower prices now prevailing.

Choosing Location.

The question as to the best locality is more difficult to answer, so much is involved in it. The first consideration from a money point of view is to get a ranch that is easily accessible to a good market. The best market in Southern California is of course at Los Angeles, where for both fancy and commercial poultry you will do well. In the north or adjacent to San Francisco of course the best market is at San Francisco. The nearer you can get to your market and where the facilities are the best is the place to locate. There are, however, other considerations, and the chief of these is the health of the owner of the ranch or members of his family. Some require sea level or ocean air, others a distance from the sea, and others a greater elevation, so my advice would be to consult a physician before buying. I have heard it said that you cannot raise fowls near the ocean. Curious idea, and entirely untrue! The hen that won the first prize at the last poultry show and the $25 challenge cup at the last show at Inglewood was raised at Manhattan Beach, where the owner is raising about three thousand chicks almost within sound of the ocean waves. Several years ago I visited a beach cottage within reach of the spray at Playa del Rey and there found a small back yard lot, kept beautifully clean, with nice healthy fowls laying eggs as well as anywhere. The owner said that her Buff Orpingtons did not do as well as the Leghorns for her, but I have a month ago brought down to the shore to Venice half a dozen of that breed, and nothing could do better or lay more eggs than they do. The beach here in California is as good as any place for fowls.

In choosing your location the soil should be considered, although this can be remedied artificially by adding to it what it lacks. Still it is of great advantage to get a desirable soil and plenty of good water when you are beginning.

The climate of Southern California is simply ideal for fowls, and, indeed, for any animal, and what may be lacking in the right food or balanced rations can easily be supplied by the owners if they will only take the trouble to do so.

POULTRY HELPS.

The growing of green food is becoming quite popular with many. The ordinary plan is to soak whole oats grains twenty-four hours previous to sowing. The ordinary green house flat is useful for this purpose. Any box from three to four inches deep will answer. It is necessary that the bottom of the box should have sufficient holes to give good drainage. Place a little damp earth over the bottom of the box and then put in about one-half inch of soaked grain, and cover this with about one inch of sand. Keep the earth moist. In a few days the grain will begin to germinate. Most feeders allow the grain to grow to be two or three inches in height before feeding it.

Any of the common advertised coal tar stock dips may be used as sprays for the hen house with satisfactory results. They may be diluted with 50 parts of water. These mixtures may be applied with a large brush or with a spraying machine. A good spraying machine is quicker and more efficient than a brush. Great care must be taken to fill thoroughly every crevice in the wall, perches and nest with the liquid. Two thorough sprayings should be made on the first day. The next day a careful examination should be made and if any mites can be found alive the house should be thoroughly treated again. Although these solutions will kill the adult mites, it is not likely that they will reach the mite eggs and prevent them from hatching. The houses should, therefore, be sprayed twice again at intervals of one week. This will catch any mites that have hatched out from the eggs laid previous to the first spraying.

Never let up on your battle on lice at this time of the year. The writer has made a lice-killing machine out of an old barrel. In this he puts about twenty-five little chicks at a time, and throws a tablespoonful of lice powder over them. Then the barrel is closed air tight and rolled on the ground till it makes eight complete revolutions. The birds are then liberated. This treatment applied once each week for a month will completely destroy every louse.

Too much green bone, meat meal or meat scraps fed the same day will work a great injury to the fowls. In pullets the combs will turn yellow and diarrhoea will sometimes follow. The bird will act drowsy and droopy till it finally dies. The badly diseased birds should be killed at once, and the doubtful ones removed to quarters by themselves where they should be fed grain and clover hay. Have no animal food in the mash. Fill hoppers with bran and grit. An hour before sunset feed a full ration of wheat. Medicine does little good in these cases. If diet will not set these birds right, little else can be done with drugs. In addition to this treatment the birds should have a liberal supply of pulverized charcoal set where they may partake at any time.—Dr. Salmon.

As the turkeys grow give them range. Turkeys do not do well in small and crowded quarters. They can be raised to some extent on a small range, but such specimens generally are stunted in size and are of poor color. If lice appear grease their heads and wing coverts with carbolized vaseline. They will not need much food, but will do better and grow faster than those kept close to the house and fed from five to six times a day.

STATE POULTRY SHOW.

The Pajaro Valley Poultry Association now comes to the front with the announcement of a state poultry show at Watsonville, October 9th, to 14th, during the mammoth state apple show which was such a great success last year.

The Pajaro Valley poultry people are great boosters, as evidenced by a membership in their association of over 190 since last March, at which time they organized. They have secured Judge Geo. D. Holden to officiate at their show, which is ample evidence of the character of their exhibition.

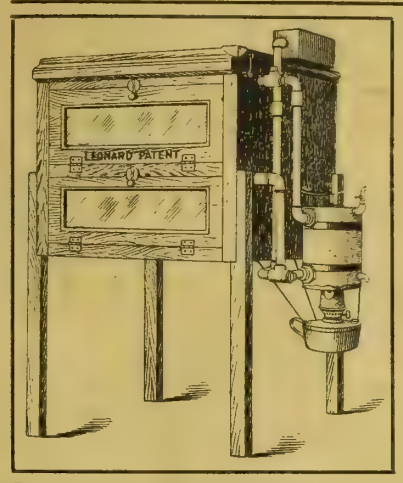
If you are not willing to do the work necessary to keep your poultry free from lice, don't try to raise it. It will not pay you.

Lee's Poultry Products

—are always good and are guaranteed to produce results. Accept no substitute for Lee's Lice Killer, Egg Maker, Germozone and other goods.

The Mandy Lee Incubators and Brooders cannot be equalled.

Geo. H. Lee Co.
225 West Second St.
Los Angeles, Cal.



Economic Incubator

Latest, Safest, Cheapest and Best

First—Because it's the last.

Second — Because it's so simple to operate, nothing to operate, nothing to get out of order.

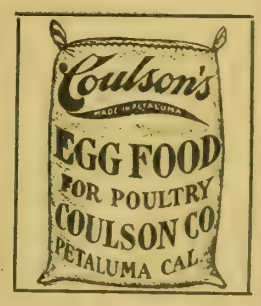
Third—Because it has top and bottom chambers and nurseries, heated by hot water apparatus; direct flow heating upper chamber, return flow heating the bottom, both chambers perfectly regulated automatically with heat and moisture without water pans.

Can be worked single or double. Designed and patented by the maker after years of experience with the defects of other machines.
Our machine occupies only half of the floor space of single chamber machines of the same egg capacity. Write for particulars.

Economic Incubator Co.
1005-7-9 W. Second St. Los Angeles, Cal.

Can You Analyze Egg Food

? ? ?

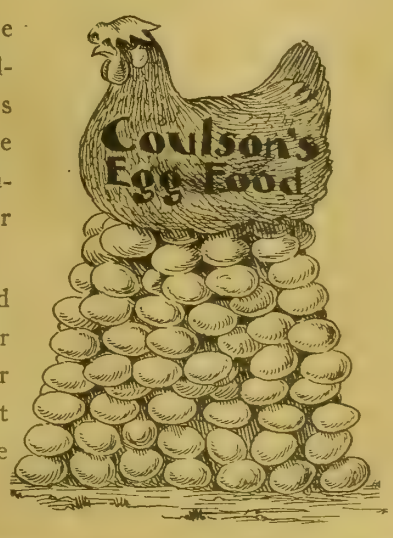


If you can, just take a pound of **COULSON'S EGG FOOD** and make a critical examination for properties contained, completeness of mixing, and egg-building power. Then take any other egg food, and make the same examination. In this way you will know why **COULSON'S EGG FOOD** is so universally used.

The same material purchased by yourself would cost at least a third more than we charge and you could never give it the thorough mixing that it received in our mill. Some of the properties you could not purchase from your dealer at all, but they are essential to successful egg-making and we spare no pains and cost to bring them long distances and incorporate them in the proper proportion into our **EGG FOOD.**

It is economy and wise dealing to secure **COULSON'S EGG FOOD.** The thoughtful poultryman recognizes that he can take no chance. His birds are his living,—his home—his fortune. He must make the most possible out of them. He cannot afford to sacrifice their health or neglect their product.

We meet the demand for the best poultry food on the market. We invite those who have never used our food to give it a trial. You will find it for sale by all reliable poultry supply houses. Insist on being supplied with Coulson's and you will have the best that money can buy or brains produce.



COULSON POULTRY and STOCK FOOD CO.

SAVE MONEY
ON YOUR POULTRY SUPPLIES

Every price quotation here given is positively the lowest for which dependable qualities can possibly be sold.

Thousands of ranchers and poultry raisers concentrate every purchase here because of the great saving in the cost of everything they need.

WE ALSO FEATURE OTHER FAMOUS STAYCO PREPARATIONS FOR VARIOUS USES.

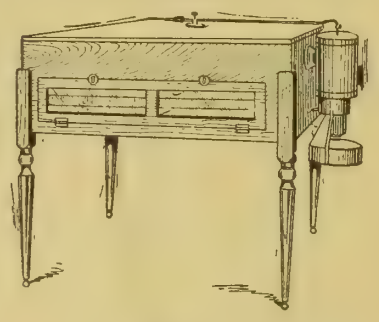
INCUBATORS.

Made in Our Factory—No Middleman's Profits.

This is a line of Incubators for those earnest poultry keepers who want nothing but a reliable Hatcher.

These Incubators are made of wood, covered with heavy galvanized iron, well finished. They are double walled; the space between being packed with cotton batting. The tops are also packed with several thicknesses of the same material to protect them from the changes of outside temperature. The windows are of double glass with air space.

The heater, the Thermostat, the lamp rest, the shield and deflector are of the best throughout.



1911 Model.

	Eggs	Weight	Price
Size A	130	60 lbs.	$13.25
Size B	140	120 lbs.	15.80
Size C	360	150 lbs.	26.00

Everything automatic. Nothing to do but to fill the lamp and trim the wick. They run themselves. We guarantee them to be satisfactory to you, or money refunded.

INSECT POWDER.

For setting hens, young chicks and the dust bath. Death to all vermin. Not intended to take the place of Stayco Liquid Lice Killer, which is always needed in this climate.

2½ lb. package.....$0.31
5 lb. package..... .55

STAYCO LIQUID LICE KILLER.

Kills lice on poultry without contact with the fowls. Spray the inside of the chicken house—fumes do the work, and not injurious to poultry.

1 quart $0.25
½ gallon ..... .40
1 gallon ..... .65

CRUDE CARBOLIC ACID.

To be used as disinfectant, deodorizer, insect killer and general purifier.

½ gallon $0.40
1 gallon ..... .65
5 gallons 2.25

STAYCO SQUIRREL POISON.

Composed of poisoned grain for the destruction of squirrels, gophers, rats, mice, etc.

1-lb. package $0.16
5-lb. package ..... .70

STAYCO ROUP CURE.

A guaranteed preventive and cure for Roup. If it fails we refund your money. Roup is indicated by a watery discharge from the eyes and nostrils, and if not checked, the head will begin to swell. Stayco Roup Cure is a positive cure.

50 cents size.....$0.35
$1.00 size ..... .65

STAYCO CHOLERA CURE.

After testing many different cures, we have found the Stayco Cholera Cure most effective. It is the best cholera remedy for turkeys. It prevents and cures roup, diarrhoea, cholera and other poultry diseases.

25 cents size.....$0.20
STAYCO Chick Feed $2.60 per 100 lbs.

STAYCO BEDBUG KILLER.

Liquid—Non-Poisonous.

As the name implies, it is non-poisonous. It is also very efficient and safe, if used away from fire and open lights.

Per Gal.....$1.75 Pint.....$0.35

POULTRY NETTING.

Sold in rolls of 150 lineal feet only. Carried in stock all widths, 12 to 72 inches. In ordering specify width, size of mesh, and gauge of wire. We quote only No. 20 gauge wire, which is the common standard used.

FARM FENCE.

Style No. 27.

Prices f. o. b. factory, Stockton, Cal. Rolls 20, 30 and 40 rods each. Top and bottom wires No. 9 wire, intermediate line wires Nos. 12 and 14. All wires of High Carbon self regulating Coiled Spring. If any of our wire fencing is not satisfactory in every respect, it can be returned at our expense and we will cheerfully refund the money paid for it.

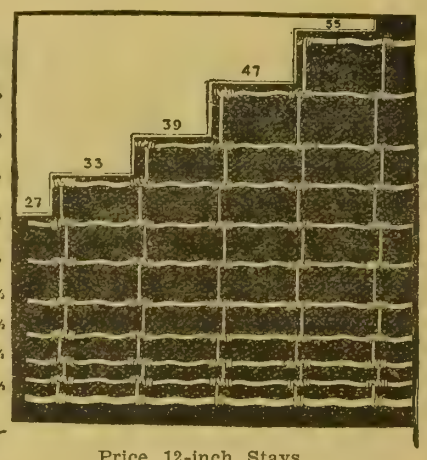
	Weight per rod.	Price per rod.
Height 54 inches	10.7 lbs.	$0.59
Height 48 inches	9.8 lbs.	.55
Height 42 inches	9.0 lbs.	.50
Height 36 inches	8.1 lbs.	.43
Height 30 inches	7.0 lbs.	.38
Height 24 inches	6.3 lbs.	.33
Height 20 inches	5.4 lbs.	.28

SQUARE MESH FARM FENCE.

Style No. 12.

Prices f. o. b. factory, Stockton, Cal. Height 27 to 55 inches. Rolls 20, 30 or 40 rods each. Stays 6 inches or 12 inches apart. Top and bottom wires No. 9, intermediate line wires No. 11, stay wires No. 12. All wires of high carbon self-regulating coiled spring.

The Tie in this fence is so constructed that it pulls tighter under strain instead of loosening, as is the case with ordinary fence ties. The greater the strain the tighter the wires lock together. The tie also aids in giving the fence rigidity, and reduces to the minimum the liability of the fence crushing down. Stay wires will not slip.



Price 12-inch Stays.

	Weight per rod.	Price per rod.
Height 55 inches	10.6 lbs.	$0.54

Questions and Answers

THE EDITOR AND STAFF

Government Whitewash.

Please publish in your paper formula for government whitewash.—R. H., Fallbrook.

Slack one-half bushel unslaked lime with boiling water, keeping it covered during the process. Strain and add one peck of salt dissolved in warm water, three pounds of ground rice boiled to a thin paste, one-half pound powdered Spanish whiting, one pound clear glue dissolved in warm water. Mix these well and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace and when used put it on as hot as possible with a paint or whitewash brush.

Standard For Rhode Island Reds.

How much of wing and tail feathers of Rhode Island Reds should be black? Is it all right for some of the long feathers to be partly red and partly black? What shade of red should the neck be, the back, the underparts? Is a very dark red, almost a blood red color, allowable on back and neck? This refers particularly to cock. Should the comb in a single comb variety be large or small, and how many points should it have?—I. H. H., Pixley.

Requirements in American Standard of Perfection are:

The general surface of the plumage should be a rich brilliant red, except where black is specified, and should be free from shafting or mealy appearance. The dark red on back is allowable in cock, but the less contrast with breast the better. In the wings the primaries should have lower web black, upper red. The secondaries should have lower web red and upper black. Wing coverts should be black. The main tail feathers and sickle feathers in the cock should be black with greenish shading; tail coverts mainly black running into red near the saddle. The tail of hen should be black except two top feathers may be edged with red. Under color should be red or salmon, free from slate or smut. Comb should be of medium size, having five even serrations, those in front and rear smaller than those in the middle.

Cherry Slug.

Please find enclosed some cherry tree leaves from my orchard which I would like to have you examine and let me know what the insects are, and how to rid my orchard of them.—J. I., Etiwanda.

This query was answered by E. W. Rust, of the Whittier Pathological Laboratory as follows:

Although the larvae arrived in a mumified condition and were very nearly unrecognizable, the cherry leaves showed a characteristic injury due to the cherry slug, Selandria cerasi. If the pest has not already disappeared it will doubtless do so very soon. However, if a remedy is deemed necessary the following spray applied by power or hand pump will prove effective if carefully applied: Lead arsenate 3 to 6 pounds; 100 gallons of water.

Red Ants.

What shall I do to get rid of little red ants? They are all over the yard and in the house.—Subscriber, Orange.

Get an original package of buhach, or if unable to get that, the ordinary Persian insect powder, if comparatively fresh, will answer. Buhach is a California product and more likely to be in good condition than the imported. This for the house is the best thing we know unless it is some of the ant pastes or similar preparations which have been advertised in the Cultivator. As to handling them in the yard where they have well defined holes or gathering places, the use of carbon bisulphide, boiling water or gasoline will destroy them entirely, while the buhach merely drives them away.

Alfalfa Seeding.

I sowed late in the spring time alfalfa and secured only about a half stand. Would you replow and refit the ground, or simply disk and reseed?—Subscriber, Parlier.

We would refit the ground entirely, get the very best seed bed possible and in October give heavy seeding with expectation of securing good stand. We say October. That would be our choice knowing no more of local conditions than we do. Your own neighbors can give advice in this particular.

Root Knot.

My peach trees have excrescences that have grown out from the trunk just below the surface. Trees seem to be making good growth and show no lack of vigor. How serious is this trouble? Will the trees be destroyed or their fruitfulness impaired? Can you suggest effective treatment. Is the disease transmitted in the soil, and should I remove these trees may others of a similar kind be planted? Is the disease confined to peaches and apricots? Would trees budded on Myrobolan stock be subject?—Subscriber, Hemet.

This is the ordinary crown gall or root knot which is a serious problem in California orchards. Once the ground has been thoroughly infected with the fungus all other trees planted there will be sure to be attacked. This does not obtain with citrus trees and some others. Walnuts and apples may be said to be practically immune, but all the stone fruits are very susceptible. When the knot first forms it may be removed, being careful to cut down to healthy wood, then painting the cut surface with Bordeaux mixture. This treatment is fairly effective. When the growth has wholly encased the crown, however, there is little use of trying to effect a cure. As the inquirer says, the trees may yet be looking healthy and still growing, but ultimately the effect will be more serious. We have however known of trees continuing to bear for years after the disease has been manifested. Myrobolan stock is not immune.

Nematode Worms.

I am sending roots of black eye beans. What is the matter with them and what causes the nodules or excrescences on the roots? Tops begin to turn yellow, soon dry and the vine dies. The ground is well irrigated. The trouble seems to be spreading in the field. The beans were planted in May. Is there anything that will prevent spread of the trouble?—Subscriber, Santa Ana.

This was referred to Dr. J. Eliot Coit who pronounced it a case of nematode worms for which there is practically no treatment except to plant upon the land crops upon which the worms will not feed and starve them out. Then beans may again be planted until the ground becomes infested a second time.

Nematodes on Melons.

I send cantaloupe root which is infested with some growth which kills plants. Many over the field are beginning to show the same trouble. The ground was previously planted to celery and I wish to plant a winter crop of peas and melons again another year. Would next year's melons be affected in the same way?—Subscriber, National City.

This, like the above, is simply a case of nematode worms living within the root and causing growth of galls. They are a serious pest, and we presume, as above noted, the only

(Continued on Page 209.)

This Traction Engine Will Save You Money

RARE PLANTS

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

FARM LANDS FOR SALE.

For Sale—

OWENS RIVER VALLEY

RED APPLE LAND.

Los Angeles' new water supply from the Owens River Valley opens up the most fertile land in all of Southern California. This land is wonderful in its productiveness, beyond belief. Potatoes that run as high as 500 bushels to the acre, with an average of 330; alfalfa, 3 tons to the cutting; timothy, with 10-inch heads; corn, 70 bushels to the acre, and famous for hogs; the world's prize at the Portland Exposition for honey; the finest apples grown on the Pacific Coast, Spitzenbergs and Winesaps, the famous varieties; no better poultry country in California.

No other land in California can compare with it; foothill land with gentle slope, giving perfect drainage; one of the most complete gravity concrete water systems in the State now being installed by men whose irrigating systems in the orange belt of Southern California stand as models for model orchard irrigating. Water from the hundreds of lakes and the high Sierras, giving an inexhaustible and assured supply. The Southern Pacific's new main line to the East now runs through the valley. The choicest apple land will be subdivided into ten, twenty and forty-acre tracts.

The elevation is 4000 feet. Typical California summers, with no intense heat, and with the thermometer at 10 deg. above at the coldest. Practically no rain—about four to five inches during the entire year; 300 days of sunshine, absolutely no fog; has the finest scenery in America; the high Sierras at your very door; trout streams within walking distance. You can leave the valley in the morning, go to the summit of the Sierras, 14,000 feet elevation, camp at one of the beautiful mountain lakes and return to your home the same evening.

This land is not for speculators, but for real serious farmers, who know the value of good land and water when they see them. Will send pamphlet and pictures upon application.

The JAMES R. H. WAGNER CO.,
Room 10,
329 So. Hill St.,
Los Angeles, Cal.

Please mail, without expense to me, your printed matter on Owens River Valley lands.

Name.....

Address.....

For Sale—Rancho Summermont of 44 acres, situated in the beautiful and fertile El Cajon Valley, eighteen miles from San Diego. Ranch is improved with 9 room house with good barn and outbuildings, is irrigated with good well and new engine and pumping outfit, and two and one-half inches flume water. Has 12 acres citrus fruits, about 12 acres in deciduous fruit, shade and ornamental trees, with magnificent palm drives. Balance of land is used for grain. This would be an ideal location for a sanitarium, as well as for a private home. For further particulars address Summermont Ranch, El Cajon, San Diego Co., Cal.

For Sale—

FARM LANDS FOR SALE.

If you want to buy a small ranch, orchard or large farm, write us, explaining exactly the kind of property you are looking for.

We deal in farm lands only, and make a specialty of Southern California and San Joaquin Valley farms.

With the hundreds of different farms listed in our office, we are naturally able to find the bargains, and it will pay you to investigate our lands.

If you want to trade your farm for another farm, tell us about it, giving us all the details. We are fully equipped to handle your property.

The JAMES R. H. WAGNER Co.
Room 10.
329 S. Hill St., Los Angeles.
Members L.A.R.B.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale or Exchange—Property of every description in every direction. With my "Resident Agents In All California Districts" gives me positively the largest list of properties for sale and exchange in California. It will pay you to see me before buying or exchanging your property. A. D. Bowman, 503 Higgins Bldg., 2nd and Main Sts., Los Angeles, Cal.

FARM LANDS WANTED.

If you wish to sell or exchange your farm, write to this office, giving all particulars. Our business is entirely farm lands in California. We have a half dozen salesmen, all of whom are farmers, and devote their entire time to buying, selling and exchanging farms.

If you want to trade your farm for some other farm, or even city properties, give us all the details; or, if you wish to purchase a new farm or ranch, ask us to send you a list of our different properties.

QUERIES.

(Continued from Page 207.)

medy is starvation. It is barely pos-ple that fertilizing with nitrate of da or the use of lime will reduce the ouble, but we do not think this ould be profitable and practical. rtilizing heavily with tobacco dust ows good results. In hothouses, or here land is extremely valuable, eam pipes have been laid through e ground, and by heating the ground to a high temperature all such life s been destroyed. For ordinary ld culture where beans, melons, cumbers and some other garden plants e raised, and for vines, figs and aches amongst the larger fruits, is would not be practical. The inease of the worms is greater in ils which have been recently fertil-ed with coarse stable manure.

oup.

I am sending you under separate ver a specimen of a substance which llects in the eye of my thorough-ed bronze turkey gobler. I first no-ced about five months ago that his ad was slightly swollen and he emed a little droopy, and a few days er I discovered that there was some-ing in his eye, and I caught him d made an examination and found substance like that I am sending, d every day since I have removed out as much as I am sending and equently more. My entire flock is rfectly healthy and he seems in per-ct condition otherwise, except that e eyeball seems to have perished. you think he would do for a eeder another year?—Amateur, Mor-nhill.

Your turkey has roup of the eyes d the best treatment you can give m is to remove as you are doing the eesy substance which forms in the e and every day wash out the place th water and peroxide of hydrogen xed in equal parts. The govern-nt bulletin recommends permanga-te of potash for roup of the eyes. ough permanganate to make the ter a bright pink. I think however at "Germozone" would be even bet- because it has both permanganate d bluestone in it. Use it weak ac-rding to directions. Your turkey ll have lost entirely the eye when gets well. I cannot advise you to ep him as a breeder for another ar.—Mrs. A. B.

lving Time.

have a small Jersey cow, about years old that has not had a calf about three and one-half years. I pect her to come fresh in about a nth. I did not succeed in drying r until within the past few days. account of her not having been sh for so long I anticipate trouble d would like to do what I can to event anything which might have en avoided if taken in time. Being new hand in the farming business ish your advice as to the treatment care of this cow during the next rty days.—W. A., Cucamonga.

Why do you expect any trouble with s cow? I have not found that a cow at had not trouble in her last calv-; was any more subjected to trouble length of period between calves. e important thing for the last thirty ys is to keep the cow where she can ve moderate exercise and on a light ative diet. Green grass is of course st of all. The next best is bran feed moistened hay. Observe the dung see if it is soft and natural looking. e amount of feed should be of the n the same in weight she has been eiving. If she has not been having y grain feed begin to give it slowly first. Now as to her physical con-ion, if she is very fat reduce amount feed and try to bring her down a le in condition. As you say you ve little experience with cows I hes-itate to tell you to give her good physic of a pound and a half of Epsom salts with a tablespoonful of ground ginger the day before she calves. The reason I say hesitate is that an animal is easily drenched when one knows how but it is sometimes fatal if the liquid goes down the windpipe into the lungs. Some of your neighbors can probably do this for you all right. I have never lost a cow by drenching and the ordinary milkers do it all right. A cow that is kept staked should have a walk of a block or two once a day for exercise.—M. E. S.

"Little Leaf."

Enclosed find twigs of plum and peach trees, showing a spider web on them which seems to kill the trees. These trees were planted last spring (from the nursery), and also those which were planted a year ago are dying. What is the trouble and treatment?—G. S., Delano.

This query with specimen was referred to E. W. Rust, of the Whittier Pathological Laboratory, and he writes:

"The peach trees show no signs of insect trouble, other than the spider web spoken of. This spider web is surely not the cause of the unhealthy condition of the tree, but simply happens to be there because the spiders find these dead or dying twigs a suitable place in which to fasten their webs. I showed the twigs to Professor R. E. Smith, and he says to refer your subscriber to an article written by him in your paper for May 25, 1911, entitled 'Tree Troubles—Their Causes.' On page 648 of that issue he deals with the 'Little Leaf' of the peach, which seems to be the trouble with the twigs sent us."

From the article referred to we quote:

"The disease is characterized by the development of spindling, yellow, sickly looking shoots on the new growth, with small, narrow, yellow leaves. The leaves along the shoots drop off during the summer, leaving tufts at the ends. Fruit fails to develop, shrivels and drops. Worst on trees from three to seven years old. This trouble also attacks other stone fruits. . . .

"Subsoil examinations showed that the disease was practically confined to trees on light, sandy soils or subsoils, where the effects of the dry year of 1910 had been more pronounced. From these facts it appeared most probable that here a very specific disease had been caused by the preceding abnormally dry season. It all goes to show the necessity of actual knowledge at all times of the moisture condition of our subsoils. The effects attributed to parasites, lack of fertilizers and all sorts of obscure conditions, which are really due to nothing more than a lack of or irregular supply of water, brought about either by actual deficiency or bad physical soil conditions are too numerous to mention."

Windbreak.

Would you recommend crab apple trees for windbreak? Are there varieties of pears suitable? Would poplars be preferred? Next to Bartletts, what variety of pears would you recommend for commercial purposes for Southern California orchards, soil well drained but slightly heavy?—Reader, Pasadena.

We would much prefer the ordinary Monterey cypress, which is a far more rapid grower than any tree mentioned by the inquirer. It has, however, one fault—it is short lived. Eucalyptus would be preferable to the poplar, for its wood is of greater value, and as a windbreak it is fully its equal. Eucalyptus is generally considered a soil robber. Still, if a windbreak has to be provided for, the ground to grow it must also be granted. The apple or pear would not grow high enough for a windbreak. Next to the Bartlett, for commercial purposes, we would prefer the Winter Bartlett. Winter Nelis and other varieties have not proven good bearers in Southern California.

Irrigating Olives.

I have recently bought an olive grove which has had no irrigation for six years. Would you advise giving it thorough irrigation and cultivation each month, beginning this month, or would it be objectionable in starting new growth and possibly blossoms at the wrong time?—Subscriber, Highland.

Such a question can hardly be answered without knowing further particulars in the case, but our impression is that the orchard should be allowed to stand until another rainy season. Since it has lived six years, we believe it is better to trust it another three months rather than begin irrigaiton so late. Then, after the rains and deep plowing of the soil, heavy irrigation could be taken up in the spring-time and the ground so filled with moisture that it would make a continuous summer's growth possible. We believe a year from this fall your trees would be in better shape than if you began in midsummer.

Vinegar From Peelings.

Mr. T. W. Ewing, of Long Beach, sends us his method of making vinegar from peelings of apricots and peaches: "Fill vessel two-thirds full of peelings or mashed cull fruit, washed clean. Protect with thin cloth and let stand three weeks. Remove peelings and strain through wire sieve and also thin cloth. This will make vinegar, but not number one vinegar. Now add four teacups of sugar to each gallon, put back into clean vessels, and let it thoroughly work until a thick mother rises on top, which will be about one month. Remove this, strain and put in jugs, placing a part of the mother back in each jug or vessel, and in a reasonable time you will have first class vinegar that is nice, clean and wholesome."

Sebastopol's Apple Show

Official List of Apple Awards.

The people of Sebastopol and Sonoma County are jubilant over the success of their second annual Gravenstein Apple Show held last week. Financially and in every other way it was a winner. The crowds that thronged the exhibition tent saw beautiful fruit displayed with skill and taste. Below we give the official list of apple awards. The judges awarding the prizes were H. C. Atwell of Forest Grove, Oregon; Frederick Maskew of Sacramento, and P. J. O'Gara of Medford, Oregon.

CLASS I—APPLES.

Packers' Entry: The judges say: "In view of the extent and meritorious display and the evidence of painstaking work in the making up of these exhibits, we, the judges, respectfully suggest that the Earl Fruit Company, Garcia & Maggini and the Sebastopol Apple Growers Union be each awarded a complimentary gold medal."

Growers' Entry—Best 60 boxes of Gravensteins: First prize, Mrs. Ida S. Hunt; second prize, John W. Turner; third prize, W. Y. Walker; fourth prize, I. B. Morris.

Best 50 Boxes of Gravensteins: First prize, Cochran & Hotle; second prize, J. J. Alves; third prize, W. J. Bower; fourth prize, Maddocks & Treadway.

Best 16 Boxes of Apples (several varieties may be used): First prize, Kauffman & Arnold; second prize, W. H. Baker; third prize, Beattie & Bassett; fourth prize, Laura E. Barlow.

Best Exhibit Seven Varieties (in regulation box): First prize, Mrs. J. W. Turner; second prize, Kauffman & Arnold; third prize, Lawrence Meyer.

Best Ten Boxes of Gravensteins: First prize, Cochran & Hotle; second prize, M. J. Moniz; third prize, Laura E. Barlow.

Best Five Boxes Gravensteins: First prize, T. J. Pilkington; second prize, M. J. Moniz; third prize, Laura E. Barlow.

Best One Box of Gravensteins: First prize, Mrs. J. W. Turner; second prize, D. U. Toffelmier; third prize, M. J. Moniz.

Best Display of Apples in Plates (not less than twelve plates, and five apples to a plate): First prize, Kauffman & Arnold; second prize, Ida S. Hunt; third prize, Laurence Myer; fourth prize, D. U. Teffelmier; fifth prize, Sebastopol Grange; sixth prize, O. M. Winkler; seventh prize, Laura E. Barlow; eighth prize, Robert Linebaugh; ninth prize, Frei Bros.

Best Exhibit of Apples in Baskets (not less than six baskets): First prize, D. U. Teffelmier; second prize, Ida S. Hunt; third prize, Laura E. Barlow; fourth prize, Healdsburg Chamber of Commerce.

DISTRICT EXHIBITS

Best Exhibit From One District: First prize, Stony Point; second prize, Forestville Ranch; third prize, Graton; special mention, Pleasant Hill.

CLASS II—FEATURE EXHIBITS.

Best Feature Exhibit: First prize, Pleasant Hill; second prize, Stony Point; third prize, Sebastopol Japanese Society; fourth prize, W. C. T. U.; fifth prize, W. S. Liddell; sixth prize, Glockner & Dorward; seventh prize, Boys and Girls Aid Society; eighth prize, Forestville; ninth to eighteenth prizes, Analy Union High School; tenth prize, Graton; eleventh prize, Sebastopol Grange; twelfth prize, M. C. Kauffman; thirteenth prize, F. Wedehase; fourteenth prize, Western Apple Vinegar Company; fifteenth prize, O. M. Winkler.

CLASS III—JUVENILE SECTION FEATURE EXHIBITS.

First prize, Harold Baker; second prize, Ben and Hall Woodworth.

CLASS IV.

Best Exhibit of Horticultural and Agricultural Products From One Ranch: First prize, D. U. Toffelmyer; second prize, Frei Bros.; third prize, Mrs. A. Woodworth; fourth prize, Occidental District.

Best Exhibit of Corn on Stalk: First prize, Sebastopol Grange; second prize, F. A. Brush; third prize, Healdsburg Chamber of Commerce.

Best Exhibit of Grain in Sheaf: First prize, Frei Bros.; second prize, Graton District; third prize, Sebastopol Grange.

Best Exhibit of Spuds: First prize, M. J. Mullaly; second prize, D. U. Toffelmier.

Best Exhibit of Vegetables: First prize, D. U. Toffelmier; second prize, Frei Bros.; third prize, D. B. English.

Best and Largest Exhibit of Pumpkins: First prize, Sebastopol Grange; second prize, Kauffman & Arnold.

DRIED FRUIT EXHIBIT.

Best Exhibit of Gravenstein Apples, Five Boxes of Twenty-five Pounds Each: First prize, Y. Fujii; second prize, Kauffman & Arnold; third prize, Singmaster Bros.; fourth prize, Mrs. C. P. Weyhe; fifth prize, Frei Bros.

Largest and Best Exhibit From One Farm (all farm products considered): Frei Bros.

SPECIAL PRIZES.

Best 25 Boxes of Apples (regardless of variety): First prize, J. W. Turner; second prize, Charles Solomon; third prize, Mrs. C. P. Weyhe.

A complimentary gold medal was awarded Luther Burbank's exhibit. None of the fruits or flowers shown by Mr. Burbank were in competition, but the Sebastopol Gravenstein Apple Fair Association honored him by bestowing the medal for his meritorious exhibit, which has proved such a fine attraction in the pavilion.

Scissors and Shears for Every Purpose

One of the principal reasons for the wonderful success of the Keen Kutter line of Tools and Cutlery is very careful adjustment. The blades of Keen Kutter Scissors and Shears meet from heel to point without any side pressure of the fingers. The joints remain tight even after years of use.

KEEN KUTTER
Scissors and Shears

are made for every purpose. All are guaranteed to give perfect satisfaction or money refunded without question.

SWEET FERN.

The subtle power in perfume found
  Nor priest nor sibyl vainly learned;
On Grecian shrine or Aztec mound
  No censer idly burned.

And Nature holds, in wood and field,
  Her thousand sunlit censers still;
To spells of flowers and shrub we yield
  Against or with our will.

I climbed a hill path strange and new
  With slow feet, pausing at each turn;
A sudden waft of west wind blew
  The breath of the sweet fern.

That fragrance from my vision swept
  The alien landscape; in its stead,
Up fairer hills of youth I stepped,
  As light of heart as tread.

With me June's freshness, lisping brook,
  Murmurs of leaf and bee, the call
Of birds, and one in voice and look
  In keeping with them all.

A fern beside the way we went
  She plucked, and smiling, held it up,
While from her hand the wild, sweet scent
  I drank as from a cup.

O potent witchery of smell!
  The dust-dry leaves to life return,
And she who plucked them owns the spell
  And lifts her ghostly fern.

THE GOVERNOR'S DAUGHTER.

The governor, florid, stout and apopletic, sat gorging himself inside the sheriff's house. Five and twenty yards away the convicts waited in their stockade for his inspection. The great boiler, containing melted turpentine, bubbled and hummed, and from the vistas of pine trees on every side carts emerged, drawn by mules and driven by trusties.

As the sheriff waited outside the house a girl appeared on horseback.

"Is popper through with his dinner?" she asked. "No, don't disturb him; he hates to be hurried when he's eating. You're the sheriff, aren't you?"

"Yes, madam," the sheriff answered, removing his hat.

"Oh, won't you please help me?" said the girl, clasping her hands. "I do so want to see the convicts. I've never seen a convict, and popper wouldn't take me along, so I just slipped away. Listen!"—as a slow snore came from within—"I guess he's having his after-dinner nap, and he'll be furious if you wake him. Won't you please let me inspect the convicts?"

No true southerner could resist such an appeal. They passed together through the iron gates of the log stockade, into the court, in which white prisoners and black stood listlessly, serving their sentences in company with several mangy curs and a litter of pigs, as well as some fowls that ran squawking before the newcomers. In the four towers at either corner guards sat immovable with loaded rifles.

"Are these all?" asked the girl, scanning the sullen groups with eager, interested, and, it appeared, half-frightened eyes.

"Where's Jim Durgan?" asked the sheriff, curtly, of an old colored trusty.

"He's in dar, sheriff," the man answered.

"Who is Jim Durgan?" the girl asked.

"He's what we call a 'lifer,' miss," the sheriff responded. "Sent up for murder five months ago. He was never much good—drunkard and all that, though a fine worker when he chose. Got into a fight with another tough character over some girl; both drew and Durgan fired first. Many thought he should have been acquitted, but I guess the jury sent him up on account of his reputation. The girl was of quite a superior class; went to the governor and begged him to intercede with the pardon board; when that failed hired thugs to break into the jail and rescue him. That's him."

A tall, lean, sunburned man came slowly out of the inclosure and looked 'round inquiringly. There was some dignity in his poise; he seemed different from the convicts around him.

"Oh, I know he has the makings of an honest man," cried the girl impulsively. "I'll go to popper and just make him intercede for him." The man smiled scornfully and eyed the sheriff with cold disdain. "Won't you take him up to popper now?" she continued, clasping her hands. "He's always in a good humor when he wakes up from his nap. Oh, please do this for me, and I'll do anything you ask me."

The sheriff looked dubious.

"He's a desperate character, miss," he answered. "Had to be put in irons once."

"I'm sure he'll give his word of honor to go quietly," said the girl with tears in her eyes. "Won't you please—please do this for me?"

The sheriff placed his hand on the prisoner's shoulder. "You're sure your pa won't be mad about it, miss?" he asked. "Well, I'll risk it." They passed out of the gates together.

As the trio approached the front of the house where the horse stood tethered the girl looked back and gave a loud scream.

"Look, look!" she cried.

The sheriff turned with a start; every one turned, even the fat governor, standing at the door of the dining room. There was a scurry, a splatter of dust, a vision of a galloping steed bearing a girl and a man who turned back to laugh insolently—then nothing but an echo among the distant pines.

"What in—" began the governor.

"Your daughter—" stammered the sheriff.

"Daughter, confound you? I'm a bachelor," the governor spluttered.—Universal Magazine.

THE BEAUTIFUL HOME.

From a series of prize essays upon the beautiful home published in the Ladies World we reprint the first prize article which has many valuable suggestions.

Home, to be really beautiful, must inspire first of all a sense of ease and restfulness. Everything must fit, and appeal not to the eye alone, but to the inner consciousness of its inmates, with the real appeal of a true home. However beautiful and costly in themselves the furnishings may be—however well trailing vines may obscure ugly views—however perfect the color-scheme—still there's no real beauty if they arouse, as one looks about, feelings of apprehension and worry because of bills staring them in the face, or because, even though paid for, they have left but an empty purse.

The home wherein the housekeeper

is too tired to be kind—too busy to find time for any of the little personal touches that make one attractive to the eye—too worried for fear of a spot or a stain to take comfort—too much occupied with the care of over-much beauty to give companionship to her husband or family—though neither money nor strength have been spared in the search for it, still has nothing of the real beauty of home therein.

See, then, in the search for beauty, that the furnishings fit your purse. See that they meet the requirements of your intellectual nature, and the individual needs of each member of your family. See, also, that they fit your strength. Many a woman who cannot afford to keep help, wears herself out, body and soul, in striving to keep her home in order—the furniture spotless—and the numerous bric-a-brac free from dust—because she is in bondage to a false idea of what constitutes a beautiful home. Better, far, do without the heavy draperies, the lace curtains, the thousand and one adornments that keep one constantly at work, and in a simpler, saner home find time to read, to smile, to tuck a rose in the hair or belt.

Many a man reaching home, weary after his day's work, either physical or mental, would appreciate far more a fresh, bright wife than all the spick and spanness of upholstered furniture, shining wood and costly rugs. Ask him wherein lies the beauty of home, and see what his answer will be. Ask yourself, and in the honest silence of your own soul's speech see what reply comes back.

I'd not in any sense belittle the artistic beauty that appeals to the eye, but in our search for it we too often are in bondage to a mistaken idea, and forget that it means far more than mere decoration of wall and floor space, the finishing of woodwork, the dim light of stained glass, or even the beauty of trailing vines or ferns or stately palms. For while all these have their place, of themselves they are nothing. It's the intangible something that gives comfort, and peace, and good-fellowship, that constitutes beauty in the home, and makes of it home — not merely the house where one resides.

RECIPES.

French Mustard.

Rub three tablespoonfuls dry mustard and one tablespoonful sugar thoroughly together; then stir in a raw egg until perfectly smooth. Add a cupful of vinegar, a little at a time; when well mixed, boil for three or four minutes, stirring constantly. When cold, add one teaspoon olive oil, beating until perfectly smooth.

Another French Mustard.

Beat together one egg (or two yolks), three tablespoons mustard, one tablespoon sugar. Add slowly one teacupful of vinegar, and cook until thick, stirring constantly.

Sweet Pickled Figs.

Seven pounds figs, three pounds sugar, one-half pint vinegar, two lemons sliced, cinnamon and cloves to taste. Boil altogether two hours (slowly).

Cream of Corn Soup.

Remove the corn from one can, cover with three cups of water; simmer for one hour, press through a sieve. Scald three cups of milk; add the corn and one tablespoonful of butter well mixed with one tablespoon of flour. Cook until smooth; season with salt and pepper, add one-half cup cream and stir until heated. Take from the fire and add one beaten egg, and serve at once.

Waffles.

Add two level teaspoonfuls of baking powder to two cupfuls of sifted pastry flour, with one-half teaspoonful of salt. Beat the yolks of two eggs light, add one and one-fourth cupfuls of milk, and add the liquid to the flour, beating until smooth and light. Beat the whites of the eggs to a stiff, dry froth and add to the batter with one tablespoonful of butter, melted. Bake in waffle iron.

Note that one tablespoonful of butter melted is a different thing from one tablespoonful of melted butter—the former measuring more than the latter.—Good Housekeeping.

Zinfandel Blanc Mange.

Soak one packet Chalmers' gelatin in one pint of Zinfandel grape juice for one hour; then set it over boiling water till dissolved. Add one quart cold grape juice; stir thoroughly. Pour into molds and set on ice. Serve when solid, with whipped cream. A little cinnamon and cloves or other spice may be added to the grape juice.

Zinfandel Punch.

One quart grape juice, one lemon, one cup sugar, one large lump of ice.

Lemon Sauce.

Two cups sugar, two eggs, juice of two lemons. Beat all together, and just before serving add a pint of hot water, a tablespoon of cornstarch and one-half cup butter. Let all come to a boil.

Orange Sherbet.

Two pounds white sugar, two quarts water, juice of six oranges and three lemons. Strain and freeze like ice cream.

Eggless Layer Cake.

One cupful of sugar, one-quarter cupful of butter; cream sugar and butter together; two cupfuls of flour, one cupful of sweet milk, two teaspoonfuls of baking powder, one-quarter teaspoonful of soda in the milk. Any filling you wish.

HOMELY HINTS.

Buttermilk is the best possible thing to clean linoleum and oilcloth.

For a bee sting, simply drop chloroform on the stung place and it will entirely kill the poison.

Apply as quickly as possible a piece of ice—holding it on the injured part for several moments and no blister will appear.

When making baked custard, if the milk is warmed before adding the eggs no water will settle in the bottom of the baking dish.

Eyeglasses may be made bright and clear by spraying them with alcohol from an atomizer and then rubbing with soft tissue paper.

A brass-headed tack driven into each of the lower corners of picture frames prevents pictures from leaving marks on the wall.

When sweeping Turkey, Axminster or any thick piled carpet, always brush the way of the pile, and it will look fresh and bright for years.

San Francisco Market

SAN FRANCISCO, Aug. 29, 1911.

Butter.

Butter has fallen off a half cent on upper grades owing to heavy receipts, 100,000 pounds being placed on the market today.
